## SUGGESTED CITATION

U.S. Bureau of the Census. U.S. Census of Agriculture: 1959. Vol. I, Counties, Part 34 Arkansas U.S. Government Printing Office, Washington, D.C., 1961

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C., or any of the Field Offices of the Department of Commerce. Price $\$ 1.50$

## PREFACE

Volume I, Counties, is one of the five principal reports presenting the results of the 1959 Census of Agriculture. This volume, in 54 parts, presents the compilation of the information given by farm operators to census enumerators in 1959.

The 1959 Census of Agriculture was taken in conformity with the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code.

The collection of the data was carried out by census enumerators directed by supervisors appointed by the Director of the Bureau of the Census and working under the direction of Robert B. Voight, then Chief, Field Division. Paul R. Squires, then Special Assistant to the Director, was responsible for the recruitment of the field staff. The planning of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Division, Warder B. Jenkins, Assistant Chief, and Orvin L. Wilhite, Assistant Chief. They were assisted by M. Vincent Lindquist, Thomas Jabine, Robert S. McCauley, John C. Mackey, Robert Standley, Hilton E. Robison, Helen E. Teir, Carl R. Nyman, Kenneth R. Norell, Gladys L. Eagle, Henry L. DeGraff, Charles H. Boehne, Joseph A. Correll, Margaret G. Wood, Evelyn K. Jett, Simon Yablon, Emma B. Gass, Charlotte J. Messinese, Bennie L. Sharp, Isaac E. Lemon, James M. Lindsey, Samuel S. Murray, William F. Kauffman, Hector Vila, Harry P. Owings, Charles A. Nicholls, Heary A. Tucker, Robert S. Boyle, Helen M. Davenport, Albert W. Graybill, Lois G. Miller, Thomas D. Monroe, Gerald P. Owens, Bernard L. Ross, Marvin M. Thompson, Helen D. Turner, Kurt W. Luethy, Arnold L. Bollenbacher, George W. Coffman, Joseph A. Horak, Samuel J. Hundley, Donald K. Larson, Chester G. Lykins, Wilmer R. Maxham, Virgil L. McClain, Jr., Darrell D. Prochaska, Robert J. Rades, Hubert E. Sites, Duane E. Traylor, Donald H. von Steen, Elmer O. Rea, Frances G. Compton, Lillian W. Bentel, and Neil V. Perkins.

Acknowledgment is made of the technical assistance and the loan of personnel by the United States Department of Agriculture in the planning, the enumeration, and the compilation of the 1959 Census of Agriculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1959 FINAL REPORTS

Volume I-Counties-A separate part for each State. Statistics on number of farms; farm eharacteristics; acreage in farms; cropland and other uses of land; land-use practices; irrigation; farm facilities and equipment; farm labor; farm expenditures; use of commercial fertilizer; number and kind of livestock; acres and production of crops; value of farm products; characteristics of commercial farms, farms classified by tenure, by size, type, and economic class; and comparative data from the 1954 Census of Agriculture.

Volume I is published in 54 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | New England States: |  | West North Central-Continued South Dakota. | 38 | Mountain: |
| 2 | Nane Hampshire. | 20 | Nebraska. | 38 | Montana. |
| 3 | Vermont. | 21 | Kausas. | 40 | Wyoming. |
| 4 | Massachusetts. |  | South Atlantic: | 41 | Colorado. |
| 5 | Rhode Island. | 22 | Delaware. | 42 | New Mexico. |
| 6 | Connecticut. | 23 | Maryland. | 43 | Arizona. |
|  | Middle Atlantic States: | 24 | Virginia. | 44 | Utah. |
| 7 | New York. | 25 | West Virginia. | 45 | Nevada. |
| 8 | New Jersey: | 26 | North Carolina. |  | Pacific: |
| 9 | Pennsylvania. | 27 | South Carolina. | 46 | Washington. |
| 10 | East North Central: Ohio. | 28 | Georgia. | 478 | Oregon. <br> California. |
| 11 | Indiana. |  | East South Central: | 49 | Alaska. |
| 12 | Illinois. | 30 | Kentucky. | 50 | Hawaii |
| 13 | Michigan. | 31 | Tennessee. |  | Other Areas: |
| 14 | Wisconsin. | 32 | Alabama. | 51 | American Samoa. |
|  | West North Central: | 33 | M Mississippi. | 52 | Guam. |
| 15 | Minnesota. |  | West South Central: | 53 | Puerto Rico. |
| 16 17 | Iowa. Missouri. |  | Arkansas. | 54 | Virgin Islands. |
| 17 | Missouri. North Dakota. | 35 36 3 | Louisiana. |  |  |
|  |  | 37 | Texas. |  |  |

Volume II—General Report.—Statistics by Subjects, United States Census of Agriculture, 1959. Summary data and analyses of the data by States, for geographic divisions, andfor the United States, by subjects, as illustrated by the ehapter titles listed below:

| Chapter | Title | Chapter | Title |
| :---: | :---: | :---: | :---: |
| 1 | Farms and Land in Farms. | VII | Field Crops and Vegetables. |
| III | Age, Residence, Years on Farm, Work Off Farm. | VIII | Fruits and Nuts, Horticultural Specialties, Forest Prod- |
| III | Farm Facilities, Farm Equipment. |  | ucts. |
| IV | Farm Labor, Use of Fertilizer, Farm Expenditures, and Cash Rent | IX | Value of Farm Products. <br> Color, Pace and Tenure of Farm Operator |
| V | Size of Farm. | XI | Economic Class of Farm. |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |

Volume III-Irrigation of Agricultural Lands. Western States (Dry Areas) - Data by States for drainage basins and a summary for the area, including number and types of irrigation organizations, source of water, expenditures for works and equipment since 1950, water used and acres served for irrigation purposes.

Volume IV-Drainage of Agricultural Lands. Data by States on land in drainage organizations, number and types of organizations, cost of drainage and drainage works.

Volume V-Special Reports, Part 1.-Horticultural Specialties. Statistics by States and a summary for the United States presenting number and kinds of operations; gross receipts and/or gross sales; sales of nursery products, flower seed, vegetables grown under glass, and propagated mushrooms; number of containergrown plants; inventory products; sales of bulb crops; employment; structures and equipment.
Titles of additional parts of this volume are not available as this report goes to press.

## INTRODUCTION

## THE 1959 CENSUS OF AGRICULTURE

History of the Census.-The 1959 Census is the 17 th nationwide agricultural census. The first agricultural census was taken in 1840, at the same time as the Sixth Decemnial Census of Population. From 1850 to 1920 , an agricultural census was taken every 10 years. With increased application of scientific findings and the growing use of mechanization in agriculture, farming practices were changing so rapidly that facts collected at 10-year intersals were no longer adequate. Aware of the need for more accurate and timely information, the Congress in 1909 ( 36 stat. 10 , sec. 31, provided for a census to be taken in 1915 and every 10 rears thereafter which was to be in addition to the census of agriculture to be taken at the time of the decennial census of population. The 1915 census was not taken, however, because of the abnormal conditions created by World War I. Beginning with 1920 , a national agricultural census has been taken every 5 sears.

Legal Basis for the Census.-The 1959 Census of Agriculture was authorized by an Act of Congress, as were all prior censuses of agriculture. "Title 13, United States Code-Census," codifled in August 1954, and amended in August 1957 and September 1960, is now the legal basis for censuses of agriculture and other censuses, and survers conducted br the Bureau of the Census. Section 142 , paragraph (a), of Title 13 makes provision for the Census of Agriculture. It reads as follows:

#### Abstract

"The Secretary shall, beginning in the month of October 1959 , and in the same month of every flfth year thereafter, take $\therefore$ census of agriculture, provided that the censuses directed to be taken in October 1959 and each tenth year thereafter, mas, when and where deemed advisable by the Secretary, be taken instead in conjunction with the censuses provided in section 141 of this title." (Section 141 relates to the decennial censuses of population, unemplosment, and housing to be taken as of the first day of April of each decennial year.) Under authority granted by Section 4 of Title 13, the Secretary of Commerce delegated "the functions and duties imposed upon him by this title" to the Director of the Bureau of the Census.

Pretest of the 1959 Census.-A "pretest" of the field procedures of the 1959 Census of Agriculture was conducted in 17 counties of the United States during the fall of 1958 . The purpose of the pretest was to provide the Bureau with a measure of the effectiveness of the questions and procedures planned for the 1959 nationwide census. Three versions of the agriculture question-naire-the first one for Northern States, the second for Southern States, and the third for Western States-were used in the pretest. Each version contained questions approprinte to the type of agriculture in the part of the country where it was used. All major aspects of field forms and procedures, from the hiring and training of crew leaders and enumerators to actual interviews with farm operators, were given a "trial run" in each of the 17 counties. Preliminary rersions of reporting forms, maps, payroll records, training guides, and instruction manuals were subjected to actual use under conditions simulating those expected in the nationwide enumeration conducted in the fall of 1959.

In making final preparations for the 1059 census, the staff of the Bureau drew heavily on the results of the pretest, as well as on experience gained from previous censuses.

Training Program for Personnel for Enumeration.- Every person hired to do work in connection with the 1959 Census of Agriculture received specialized training for his job. Stafif mem-
bers of the Washington and Regional Offices of the Bureau and of the U.S. Department of Agriculture trained approximatels 110 agriculture field assistants and 2,100 crew leaders. The crew leaders, in turn, tiained and supervised approximately 30,000 euumerators. All training was presented according to procedures contained in various gnides and manuals prepared by the Bureau. The training program included filmstrips, map-reading, practice interviewing, and practice filling of questionnaires and other census forms. In most instances, tralning sessions were beld near the areas in which employees worked and immediately prior to the beginning of their assignments.

Enumeration Period.-The actual enumeration in the conterminous United States (see page XIV) started at dates varying from October 7 to November 18, 1959. In general, starting dates were based upon regional variations in harvesting seasons and on weather conditions. The primary aim was to hare the enumeration late enough to follow the harvesting of the butk of important crops and earls enough to precede the advent of winter weather with the attending unfavorable travel conditions. The bulk of the enumeration work was completed within three to four weeks after the starting date. In Hawaii, the enumeration was made during the months of December 1959 and January 1960 ; and in Alaska, during April 1960.

Enumeration starting dates for the censuses of 1959 and 1954 are given in State table 11, together with figures showing the percentage of farms enumerated in the State during weekly periods. The average enumeration date for the 1959 census for each county is given in counts table 6 .

Data for inventory items-land in farms, machinery and equipment, livestock, and poultry-relate to the situation at the actual time of enumeration of each individual farm. Data for acres, production, and sales of crops relate generally to the crops harrested during the crop year 1959 , regardless of whether and when they were sold while data for sales of livestock and livestock products relate to the calendar sear 1959 . Since the enumeration was made before the end of 1959 , special emphasis was placed upon the inclusion of estimates for crops set to be sold and for livestock and livestock products expected to be sold in the period from the time of enumeration to the end of the calendar year. Instructions on the questionnaire and the wording of questions were designed to assure that full crop-sear or calendar-year data would be reported. For example, "How much of this year's crop was or will be sold?"

## ENUMERATION FORMS AND PROCEDURES

Authorization.-Section 5 of Title 13 of the United States Code authorizes the preparation of forms and questionnaires used $\ln$ the census. It reads as follows:
"The Secretary shall prepare schedules, and shall determine the inquiries, and the number, form, and subdivisions thereof, for the statistics, surveys, and censuses provided for in this title."
The Agriculture Questionnaire.-The questionuaire for the 1959 Census of Agriculture was prepared by the staff of the Bureau. Selection of the inquiries was based on the results of the 1958 pretest and experience gained in earlier censuses. Careful consideration was given to such factors as the current availability
of data from other sources, the possibility of obtaining data by methods other than a census, the adequacy of the data that might be obtained, and the need for and usefulness of the data. Two committees gave advice and counsel to the Burcau. One of these, a Special Advlsory Committee, was composed of members desig. nated by the organizations they represented, following an invitation from the Director of the Bureau of the Census to name a representative to serve in an advisory capaclty. The Special Advisory Committee for the 1959 Census of Agricuiture was made up of one representative from each of the following : Agrlcuttural Publishers Association, American Association of LandGrant Colleges and State Universities, American Farm Bureau Federation, American Farm Economic Association, American Statistical Association, Farm Equipment Institute, National Association of Commissioners, Secretaries, and Directors of Agriculture, National Councii of Farmer Cooperatives, National Farmers' Union, National Grange, Rural Sociological Society, and the U.S. Department of Agriculture. A representative of the Bureau of the Budget was in attendance at all meetings of the Advisory Committee.

Because of the special interest of the U.S. Department of Agriculture in censuses of agricutture, the Director of the Bureau of the Census sought the continuous cooperation of that organization in developing plans, questionnaires, and procedures for the 1959 Census of Agriculture. Working Groups were established ln the U.S. Department of Agriculture to make recommendations for the following general subjects:

```
Tenure, Land Values, and Mortgage Debt
Land Use and Conservation and Production Practices
Fiteld Crops
Fruits and Vegetables
Forest Products
Livestock, Ponltry, and Dairy
Income and Expenditure (including Contractual Operations)
Farm Labor
Equipment and Facilities (includiug Structures)
```

Each Working Group had the responsibitity for ascertaining the U.S. Department of Agriculture's need for data in the field covered by its "terms of reference" and for presenting recommendations to a small Joint Commlttee comprising representatives of both the Bureau of the Census and the U.S. Department of Agriculture. The Joint Committee received wrltten recommendations from each Working Group. The Chairman of each Group appeared before the Joint Committee as did any member of the Working Group who was needed to present supplemental information of a specialized nature.

Prior to the formulation of the questionnaire, State Agricultural Colleges and other major users of censns data were invited to suggest inquiries for the enumeration. Each member of the Special Advisory Committee had the opportunity and the responsibitity for channeling in suggestlons from the organizatlon be represented. The number of inquiries submitted from all sources greatly exceeded the number that could be included in the census, from the point of view of cost, of the respondent's time and patience, and of practical value to the majority of users of date.

The final selection included 316 questions, some of which consisted of seseral parts, for the 48 States comprising the conterminous United States. Although each of the 316 questions was asked in one or more of the 48 States, considerably less than this total was asked in any one State because of the use of "State" questionnaires. Moreover, about 50 questions out of the total were asked of approximately one-fifth of all farm operators in the State. The number of questions ranged from 159 on the questionnaire for Maine to 194 on the questionnaire for California. In all, 38 versions of the questionnaire-one for each State or combinatiou of adjoining States and two for Texas-
were used for the 1959 census in the conterminous United States as compared with 21 versions in 1954 and 41 in 1950 . A separate rersion was used in Alaska and another in Hawaii.

Differences in the questlonnatres were designed to account for regional and local differences $\ln$ agricuiture. Most, but not all, of the differences related to crops. The use of State questionnaires made possible the inclusion of separate inquiries for alt important crops grown within a State and, at the same time, a reduction in the total number of inquiries for a State. Questions that did not apply, to any considerable degree, to a particular State were omitted from the questionnaire used in that State. For example, separate questions about citrus fruits were omitted from all questionnaires except for the few States where cltrus fruits are grown. An added adrantage of State questionnaires was that productlon and sales data could be asked in the unit of measure most commonly used by the farmers in each State. Reglonal variation in the number and type of ques. tions is an important provision of the census for obtalning complete coverage of agricultural operatlons.

About 2 weeks before the start of the enumeration, agriculture questionnaires were malled to most bouseholds in rural areas. A letter was attached to each questlonnalre asking the farm operator to fill the questionnaire and to give it to the enumerator when be called. The purpose of this procedure was to save time and money in taklng the census and to improve the quallty of the information given by farm operators. By having the questionnaire abead of tlme, the farmer could determine what information would be required and could check his records in advance of the enumerator's visit. It was, however, the responsibillty of the enumerator to obtain an agrlcuiture questlonnaire for each place which qualified. If the questionnaire had been filled out by the farm operator, the enumerator was instructed to examine the questionnalre for completeness and accuracy and, if need be, to give the farmer such help as might be necessary.

Agricultural Operations.-The training of enumerators stresfed the concept that a census of agriculture is a census of agricultural operations rather than a census of farms. This concept was intended to assure a complete agricultural census free of any personal judgment by enumerators as to what constitutes a farm. In accordance with clearly defined procedures, an enumerator was required to obtain an agrlculture questionnaire for each person who had charge of one or more agrlcultural operations, whether or not be considered himself to be a farm operator. For enumeration purposes, it was considered that there were agricultural operations on a piace if, at any time in 1959
a. Any livestock (hogs, cattle, sheep, goats, horses, or mules) were kept on the place.
b. A combined total of 20 or more chickens, turkeys, and ducks were kept on the place.
c. Any graln, hay, tobacco, or other field crops were grown on the place.
d. A combined total of 20 or more frult trees, grapevines, and nut trees were on the place.
e. Any vegetables, berries, or nursery or greenhouse products were grown on the place for sale.
As a resuit of the requirement that all places having agricultural operations be enumerated, more questionnaires were obtained than are inctuded In the tabulations for farms. During the office processing operations that followed the completion of enumeration, criteria were applied to the questionnaires to sort out for tabuiation those that represented farms according to the census definition of a farm (see page XIV).

Enumeratlon Assignments and Enumeration Districts.-To assure a complete enumeration withln the time allotted, the United States (excluding Ataska and Hawait) was divlded Into 29,374 Enumeration Assignments, or EA's. Each EA comprised an
area that one enumerator could reasonably be expected to canvass within a 3 - to 4 -week period, as indicated by performance records from the 1954 census.

Each EA was made up of one or more Enumeration Districts, or "ED's," as the geographic unit for enumeration. Prior to the enumeration, the ED's were classified into three groups on the basis of the density of dweilings in relation to the number of farms, as indicated by the 1954 Census of Agriculture, the 1950 Census of Population and Housing, current popuiation estimates, and highway maps showing cuiture which were basic to establishing the boundaries of each assignment. Through the use of different canvassing procedures for each group of ED's, the Bureau was able to reduce the cost of enumeration without running any material risk of missing any farms or other places with agricultural operations. The ED groupings and canvassing procedures are described below.

Group I Enumeration Districts.-In general, ED's with no well-defined cluster of dwellings were considered to be opencountry areas and comprise Group I. For each ED of Group I, in his Enumeration Assignment, the enumerator was required to list in his Record Book the name of every head of household liring in the ED and also the name of every person not iiving in the ED who had agricultural operations there. There were approximately $20,751 \mathrm{ED}$ 's in Group I for the 1959 Census.
Group II Enumeration Districts.-Rural ED's in which the number of dwellings was iarge in reiation to the number of farms were considered to be in Group II. For each ED, in Group II, the enumerator was required to list the head of the household for all dweilings in the ED except for those on less than one acre of ground in buit-up residential areas of 50 or more dweliings. He was also required to determine, by observation or local inquiry, whether there were any farms or other places with agricultural operations in the buiit-up areas and, if so, to obtain an agricuiture questionnaire. There were approximately 7,979 ED's in Group II.
Gronp III Enumeration Districts.-Most incorporated places and unincorporated villages having approximateiy 150 or more dwellings were designated as separate ED's and are ciassified as Group III. Also, most ED's in counties around large metropolitan areas were designated as Group lll Ed's. Prior to the 1959 Census of Agricuiture, places enumerated in these areas during the 1954 Census of Agriculture were listed in the Enumerator's Record Book. The enumerator was required to visit and enumerate or otherwise account for each place listed in his Record Book. In addition, he was instructed to ask at each of these places if there were any farms or other places with agricuiturai operations in the Enumeration District, and, if so, to add them to his list and enumerate them. There were approximately 15,836 Group III ED's in 1959. According to the 1954 Census, these ED's contained 380,575 farms.
A few enumeration districts that comprised incorporated places or that were within an incorporated city were classified as Group 1 or Group II because they had a large number of farms. A few others, comprising extensive rural districts requiring considerable travel, were ciassified as Group III because they had only a smali number of farms.

Ennmerator's Record Book.-Each enumerator received one or more Record Books containing a listing form for use during canvassing. (See appendix for facsimile of one page of listing form included in Enumerator's Record Book.) The lines on the listing form were numbered in consecutive order. Except as otherwise prescribed for Group II and Group III ED's, the enumerator iisted in his Record Book the name of each head of household living in his assigned area and also the name of each person not living in his area who had agricultural operations there. As he made his listing, he also asked the questions about agricultural operations that were printed on the listing form. Answers to these questions determined, for the enumerator, whether or not an agriculture questionnaire was required for the person listed and, if so, whether he or some other enumerator was responsible for getting it. Thus, the Record Book served as an important aid to the enumerator in securing complete corerage of ail agricultural operations within his area. At the same
time, it heiped to prevent enumeration of the same place by two or more enumerators.

Enumeration Maps.-As a second ald to getting compiete coverage, each enumerator received a map or, in a few exceptional cases, a brief written description of the area assigned to him for enumeration. He was required to plan and follow an orderly route of enumeration within the boundaries of his assigned area in accordance with established canvassing procedures. As the enumerator listed a place in his Record Book, be indicated its location by copying onto his map the number of the iine on which he listed it. This numbering system indicated the enumerator's route of travel, and heiped both the enumerator and his crew leader to determine the extent of coverage of the enumerator's assignment at any given time.

Lists of Special and Large Farms.-Prior to the enumeration, a card ilst of "special and large farms" was prepared on the basis of records obtained from the 1954 census and from Federal and State agricuitural agencies. In general, "special and large farms" fell into one of three categories: (1) farms having unusualiy large acreages, ilvestock inventories, or annual sales as iudicated by available records; (2) farms known to be speciaiizing in such operations as broiler production, turkey growing, feed iots, nursery or greenhouse production, cranberry bogs, citrus groves, etc.; (3) farms that might easiiy be overiooked because they had absentee operators or were not iocaily thought of as farms, such as institutions, Indian reservations, grazing associations, etc.

Enumerators were given the cards for the speciai and large farms within their assignment areas to use as aids to obtaining complete coverage. Generaliy, the cards provided insurance against the omission of farming units that couid have a significant effect on the totals for a given county or State. The enumerator was instructed to obtain an agriculture questionnaire for each special or large farm in his area or to write an explanation on the card as to why an agriculture questionnaire was not required on the basis of 1959 operations. The crew leader had a duplicate set of cards for use in checking enumeration coverage.

Landlord-Tenant Questionnaire-As in severai previous censuses, a special iandiord-tenant questionuaire was used in some idarts of the South as a supplement to the agricuiture questionnaire. Its purpose was to heip the enumerator get complete and accurate coverage of individually operated tracts of land that were actuaily part of one operating unit under the control of one landlord. To accomplish this purpose, the enumerator was required to fill a landiord-tenant questionnaire for each landlord who had any land worked on shares. The entries made in this questionnaire inciuded the name of each sharecropper, tenant, or renter ; the amount of iand assigned to each; and the acreage and quantity of crops harvested on shares. By checking these entries against the agriculture questionnaires obtained for the individual operators, the enumerator and the Central office could verify that each part of the operating unit controlied by the landiord was enumerated and that it was enumerated only once. The landlordtenant questionnaire was used in 386 counties in the 1959 census as compared with approximateiy 900 counties in 1954.

Township Sketch Map.-In some areas of the Great Plains, a considerabie portion of land is farmed by nonresident operatorsthat is, hy persons who do not live on the land they operate or who live on it only during part of the year. Enumerators in these areas used a special mapping form, the Township Sketch, in addition to their enumeration maps as an ald to obtaining complete coverage. Each township inciuded on the sketch was identified by township and range number and was divided into 144 smail squares. In a standard section of 640 acres, each square represented a quarter section of iand, or 160 acres. As the enumerator canvassed his assignment area, he indicated the acreage and location of each farm, ranch, and tract of nonfarm
land by drawing its boundaries on the sketch. He also used a simple numbering system as a cross reference between the agricultural land identified on the sketch and the questionnaire on which it was reported. The Township Sketch was used in all counties of North Dakota and South Dakota and in selected counties of Colorado, Kansas, Minnesota, Montana, Nebraska, New Mexico, Oklahoma, and Wyoming.

Field Review of Enumerator's Work.-In the 1959 census, greater emphasis was placed on a detailed review of enumerators' work during enumeration than had been the case in previous censuses. The objective was to detect and correct enumeration errors as cariy as possible in order to achieve and maintain a high quality of individual performance. Starting on the first day of enumeration and continuing throughout the eaumeration period, each crew leader was instructed to make regular and frequent visits to his enumerators. At each visit, be was to follow a clearly defined procedure for observing the enumerator's conduct of interviews and for checking his listings, maps, questionnalres, and other forms for accuracy and completeness.

As an aid to checking coverage and enumerator efficiency, the crew leader was given a list containing estimates, based on the 1954 census, of the number of questionnaires required in each enumeration assignment area within his district, and of the mileage and time required to obtain those questlonnaires.

## SAMPLING

Use of Sampliag.-In the 1959 census, as in several previous ceasuses, sampling was used in tro ways: for enumeration and for tabulation. Sampling in enumeration consisted of the collection of information about the items inciuded in sections IX through $X V$ of the questionnaire for only a sample of farms. The "sample" items relate to sales of dairy products and sales of livestock, use of fertilizer and lime, farm expenditures, land-use practices, farm labor, equipment and facilities, rental agreements, farm values, and farm mortgage debt. The same sample of farme was used for tabulations by type of farm and by economic class of farm and for many of those by size of farm and by color and tenure of operator.

Description of the Sample.-The sample used for the 1959 Census of Agriculture consisted of all farms with a total area of 1,000 or more acres or with estimated sales of $\$ 100,000$ or more in 1959 , and approximately 20 percent of all other farms. Farms with 1,000 or more acres were universally inciuded in the sample during enumeration. As the enumerator filled the questionnaire, he determined the number of "acres in this place" (see question 7 of the agriculture questionaaire). If the acreage amounted to 1,000 or more he was required to fill sections $I X$ through XV of the questionnaire. Farms with less than 1,000 acres, with estimated sales of $\$ 100,000$ or more, were inciuded in the sample during the offce processing. For these farms the information for sections IX through XV was obtained by mail.

The selection of farms of less than 1,000 acres for inclusion in the sample was made during enumeration, according to the following procedure: As the enumerator determined that be was required to obtain a questionnaire, he assigned a number to it, whether or not he was able to obtain the questionnaire on his first visit. He assigned numbers in consecutive order, beginning with "I" for the first questionnaire required in each enumeration district within his area. He was iastructed to fill sections IX through XV on all questionnaires for which the assigned number ended in " 2 " or " 7 " (i.e. $2,7,12,17,22$, etc.).

Adjnstment of the Sample.-An adjustment in the part of the sample that was comprlsed of farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$ was made by a process essentially equivalent to stratifying the farms in the sample by
size of farm. The purpose of this adjustment was to improve the reliability of the estimates based on the sample and to reduce the effects of possible biases introduced by enumerators who deviated from the prescribed procedure for selecting the somple farms. The adjustment procedure was carried out for "blocks" of counties, each consisting of from one to ten counties in a State. To adjust the sample, separate counts were made for each county, and for the block of counties of all farms and of farms in the sample for each of 10 size-of-farm groups based on the "acres in this place" (question 7). The 10 size-of-farm groups were as follows: under 10 acres, 10 to 49 acres, 50 to 69 acres, 70 to 99 acres, 100 to 139 acres, 140 to 179 acres, 180 to 219 acres, 220 to 259 acres, 260 to 499 acres, and 500 to 999 acres. Farms of less than 1,000 acres, but with value of sales of $\$ 100,000$ or more, were excluded from these counts. For each size-of-farm group, the number of farms in the sample for the block of counties was adjusted to make it equal or approximately equal to the total number of farms divided by flve. This was accomplished for each group by the elimination or duplication on a random basis, of farms in those counties where the difference between the actual proportion in the sample and the expected 20 percent was in the same direction as the difference for the block of counties.

Estimation of Totals for the Sample,-For the items included in the sample part of the questionnaire (sections IX througl XV), estimated totals for all farms were derived from the tabulated totais for the farms in the adjusted sample. First, item-byltem totals, as tabulated for that part of the sample compriaing farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$, were multiplied by 5 . These estlmated item-byitem totals were then added to the corresponding ltem totals, as tabulated, for all farms of 1,000 acres and over and farms with estimated sales of $\$ 100,000$ and over. The resulting values represent the estimated totals for all farms.

Presentation of Sample Data.-In tables where a small amount of data based on the sample farms is presented together with data for all farms, the data based on the sample are printed in italics. Other tables contain headnotes explaining that most of the data are estimates based on reports for only a sample of farms.

Reliability of Estimates.-The estimated totals for all farms of the items enumerated for only the sample farms are subject to sampling errors. The estimated totals obtained by making tabulations for only the farms included in the sample are also subject to sampling errors. State tables 23 and 24 contain approximate measures of the asmpling reliability of the estimates for numbers of farms reporting and for item totals. Wblle these measures indicate the general lerel of sampling reliability of the estimates, they do not completely reflect errors arlsing from sources other than sampling; for example, errors in the original data reported by farmers. Errors arising from sources other than sampling may, in some instances, be relatively more important than sampling variation, especially for county totals.

The general level of sampling reliability of estimated totala may be determined from the data in State tables 23 and 24. State table 24 contains a list of items, together with a figure for each item indicating one of the four levels of ampling rellability that are presented in State table 23. For each item the sampling error according to the number of farms reporting may be determined from State table 23, ln the column for the level of sampling reliability designated in State table 24. To determine the sampling reliability for any item, reference must be made to State table 24 to find out which of the four levels of samping reliablity given in State table 23 should be used, and also the appropriate county or State table to obtain the number of farms reporting the item.

As explained in State table 23, the level of sampling reliability deslgnated as level 1 should always be used to determine the sampling rellability of estimated numbers of farms or of farms reporting.

State table 23 shows percentage limits such that chances are about 68 out of 100 that the difference between an estlmate based on the sample and the figure that would have been obtained from a tabulation of all farms would be no more than the percentage specified for the estimated number of farms reporting that item. The chances are about 99 out of 100 that the difference would be less than $21 / 2$ times the percentage specified.
As indicated by the percentages in State table 23, the smaller the number of farms reporting a given item, the larger the relatlve sampling error in the estimated total for that item. Even so, conslderable detail is presented for each item, by several classifications of farms, in order to permit the appraisal of estimates for various combinations of Items not slown in this report. Percentages and averages that may be derived from the tables will generally bave greater relative reliability than the corresponding estimated totals. However, slgnificant patterns of relationships may be observed in the estlmated totals even though the individual data are subject to relatively large sampling errors.
The data representing estimates based on a sample of farms for the 1954 census were obtained in essentially the same way as in 1959. Therefore, State tables 23 and 24 may also be used to determine the sampling errors for the 1954 data.
Differences in Data Resulting From Differences in Tabulating Procedures.-Many of the figures in the detailed State tables represent estimates obtained by tabulating only the sample farms. The totals for these detalled distributions will generally differ somewhat from totals presented in other tables obtained from different distributions which were tabulated on a 100 percent basis. Moreover, although most of the figures presented by counties were obtained from tabulations of all farms, the data in county table 4 for commercial farms, and all of the data in the county tables on dairy products and livestock sold, fertilizer and lime, farm expenditures, land-use practices, farm labor, facilities and equipment, and value of land and buildings were estimated for each county on the basis of data tabulated for the farms in the sample. The State totals in the county tables for these items, though based also on the sample, were obtained in a different series of tabulating runs, and so may differ slightly from totals presented in some State tables. For reasons of economy the sample distributions were not adjusted to the 100 percent totals even when such totals were available, nor were slight discrepancies resulting from different runs of the sample data always reconciled unless the differences were large enough to affect the usefulness or reliability of the data.

## PROCESSING OPERATIONS

Completion of Enumeration.-As an enumerator completed his assignment, he turned the portfolio containing questionnaires and other census materials over to his crew leader. After making a final review of the enumerator's work, the crew leader mailed the portfolio to the Agriculture Processing Office at Parsons, Kansas. There, each enumerator portfolio was thoroughly checked for completeness of all required forms and for correct application of the sampling procedure.

Editing of Questionnaires.-Each agriculture questlonnaire was individually edited and coded before the information was transferred to punch cards and tabulated. As the first major step in the editing process, questionnaires that did not represent farms uccording to the census definition were withdrawn from fur-
ther processing. (See p. XIV.) As the second major step, the remaining questionnalres were examined for errors, omissions, and inconsistencies. Among the speclicic items subjected to consistency checks were the following:
a. Total acreage compared with its distrlbution by use.
b. Acreage of individual crops harvested compared with total cropland harvested.
c. Irrigated acreage compared with total acres in the farm.
d. Total acreage of indivldual crops for all purposes compared with the acreage harvested for specific purposes.
e. Quautity of crops harvested in relation to acreage harvested.
f. Sales in relation to production and, for livestock, to inventories.
g. Total livestock compared with the inventory by age and sex.
h. Expenditures compared with production and inventories.

Obvious errors in calculations or in units of measure, and misplaced entries were corrected as they were found. Entries not clearly legible were rewritten. Many omissions or inconsistencies were disregarded during editing. Those of significant magnitude could be and were handled more efficiently and economically during mechanical processing operations. Questionnaires containing major inconsistencles and omissions were referred to members of the technical staff for review. Depending on the magnitude of the data involved, the technical staff corrected (or supervised the correction of) the questionnaires either on the basis of information reported for other farms of similar type in the area or on the basis of additional information received in response to letters directed to the farm operators.
Coding of Questionnaires.-Most of the numerical information on a questionnaire was self-coding in that the inquiry number was utilized for the item identification on punch cards or on tabulations runs. However, some manual coding was also necessary for such items as irrigated crops for selected States, crops infrequently reported, miscellaneous poultry, etc. Code numbers were entered on questionnaires to classify farms and, in some cases, to identify data for individual items. All farms were coded by size of farm in terms of total acreage, by race, and by tenure of operator. Farms in the 17 Western States, Louisiana, and Hawaii were also coded on the basis of irrigated cropland and irrigated pasture. Additional codes were applied to all farms included in the sample to classify them by type of farm and by total value of agricultural products sold. Individual items were coded only where reports were receiced for crops or poultry not covered by separate inquiries on the questionnaire. This coding was necessary to assure inclusion of the data in the appropriate farm product totals.
Tabulation of Data.-After the questionnaires were edited and coded, the information on them was punched on cards. The cards were then mechanically sorted and fed into machines whlch transferred the data to tabulation sheets. One of the lnitial and primary steps in the machine handling of the punch cards was to separate and list those cards which lacked necessary information, those which contained inconsistent or impossible data, and those on which the data were possible but of such magnitude that a further review of the individual questionnaires was warranted. The listing sheets were examined and, as necessary, the cards were corrected. When the cards for a particular county were considered satisfactory, the data were tabulated.
Subject-matter specialists of the Bureau and the U.S. Department of Agriculture examined all tabulations for reasonableness and consistency. As necessary, they made corrections on the basis of a further review and reappraisal of the original reports and verification of the editling, coding, and punching.

## PRESENTATION OF STATISTICS

Statistical Content of This Report.-This report is part of Volume I of the 1959 Census of Agriculture. Volume I consists of 54 parts, each part containing information about agriculture for a single State, Commonwealth, or Possession. Each part contains county data for that particular State or area. The term "county," as used in this report embraces election districts in Alaska, parishes in Louisiana, municlpios (municlpalities) in Puerto Rico, etc. The statistics for 1959 were obtained from the Census of Agriculture taken in the "conterminous United States" (see following paragraph), Hawail, and Puerto Rlco during the period October 1959 to January 1960 and in Alaska, American Samoa, Guam, and Virgin Islands as of April 1, 1960. Comparatlve data for years prior to 1959 were obtained from earlier censuses.

In the planning of the publicatlons for the 1960 Censuses of Population and Housing and the 1959 Census of Agriculture, the term "conterminous United States," recommended by the Board of Geographic Names to designate the 48 -State area as it existed before Alaska and Hawali became States, was adopted by the Bureau of the Census.

The definitions and explanations in this introduction for volume I generally have application broad enough to include the States of Alaska and Hawaii, and the Commonwealth of Puerto Rico and the island possessions. However, specific application in many lnstances may be limited to the conterminous United States; for example, references to earlier censuses, to the sampling methods and procedures, to specific sections or questions on the questionnaires, and to specific table numbers.

For each part of volume I (one part for each State or area), a facsimile of the appropriate questionnalre is reproduced in the appendix.

The statistlcs for States and countles are presented according to the same general plan as was followed in the volume I reports for the 1954 and the 1950 censuses. State and county totals are given for nearly all items for which information was obtained in the 1959 census. However, most of the data by economle class of farm, type of farm, and color and tenure of farm operator are given only for States.

Comparative data for the States are given for each census year beginning with 1920. Comparatlve data for counties are giren for the years 1959 and 1954. For some items, the data obtained from the 1959 census are the only ones arailable. For comparative purposes 1950 data are carrled in county table 6 for the kind of road on which farms were located.

Comparabillty of Data.-The data obtained from the various censuses of agrlculture are not strictly comparable for all items. For example, differences from one census to another in the time of enumeration, the wording of the questions, and the definition of a farm cause some iack of comparabllity. Differences considered to have a significant effect on the comparability of data are described in the text and/or mentioned in footnotes to the tables.

Minor Civil Divisions.-As in prior censuses, data for most of the items included in the 1959 Census of Agriculture were tabulated for minor civil divistons. The term "minor civil division" applies to the primary subdivlsion of a county into smaller geographic areas such as townshlps, precincts, districts, wards, beats, municipalities, etc. Figures for these smaller geographle areas are not included in any of the published reports, but they may be supplied upon request and payment of the costs of compiling and checking the data.

Prlor to the 1954 Census, an enumeration assignment did not Include more than one minor clvil division, even in cases where the township, precinct, etc., did not have enough farms to provide a full workload for an enumerator. In 1954, and again in 1959,
the aim was to make enumeration assignments large enough to keep each enumerator fully occupied in his area for a 3- to 4-week period. Hence, in some areas, two or more adjoining minor civil divisions were combined into one enumeration assignment. An enumeration assignment never comprised the whole of one minor civil division and a part of another, nor a part of two or more minor civil divisions. A minor civil division that included too many farms for one enumerator to cover during the enumeration period was divided into two or more enumeration assignments.

In some cases, the minor civil division tabulations provide totals for a single minor civil division, even when such totals required a grouping of enumeration assignments. In other cases, the minor civil division tabulations provide totals for a combination of two or more adjoining minor civil divisions. The data for each individual minor civil division included in such totals can be tabnlated separately, bowever, since each questionnaire obtained in the census contains the designation of the minor civil division in which the farm headquarters was located. An additional charge must be made for a separate tabulation of any smail area included in a total for two or more combined minor civil divisions.

Requests for census information for minor civil divisions should be directed to the Agriculture Division, Bureau of the Census, Washington 25, D.C.

## DEFINITIONS AND EXPLANATIONS

Descrlptlve Summary and References.-The definitions and explanations that follow relate only to those items that are considered to be inadequately described in the tables where they appear. Although the descriptive terms and explanations refer specifically to the 1959 Census of Agriculture, many of them also apply to earlier censuses. Nost of the definitions consist of a résumé of the questionnaire wording, supplemented by excerpts from instructions given to enumerators. For exact wording of the questions and of the instructions included on the questionnaire, see the facsimile of the 1959 Agriculture Questionnaire in the appendix of this report.

An analysis of the questions asked in the 1959 census, and of the data obtained, is given in Volume II, General Report, Statistics by Subjects, United States Census of Agriculture, 1959. The general report presents statistics for States by subject matter.

## General Farm Information

Census Definition of a Farm.-For the 1959 Census of Agriculture, the definition of a farru was based primarily on a combination of "acres in the place" and the estimated value of agricultural products sold.

The word "place" was defined to include all land on which agricultural operations were conducted at any time in 1959 under the control or supervision of one person or partnership. (For definition of "agricultural operations", see p. X.) Control may have been exercised through ownership or management, or through a lease, rental, or cropping arrangement.

Places of less than 10 acres in 1959 were counted as farms if the estimated sales of agricultural products for the year amounted to at least $\$ 20$. Places of 10 or more acres in 1959 were counted as farms if the estimated sates of agricultural products for the year amounted to at least $\$ 50$. Places having less than the $\$ 50$ or $\$ 250$ minimum estimated sales in 1959 were also counted as farms if they could normally be expected to produce agriculturai products in sufficient quantity to meet the requirements of the definition. This additional qualification resulted in the inclusion as farms of some places engaged in farming operations for the first time in 1959 and places affected by crop failure or other unusual couditions.

To avoid biases arising from an enumerator's personal judgment and opinlon, the Bureau did not give enumerators the defini-
tion of a farm. Instead, enumerators were instructed to obtain questionnaires for all places considered farms by their operators and for all other places that had one or more agricultural operations. (See "Agricultural Operations", p. X.) In 1954, enumerators were instructed to fill questionnaires on the same basis as in 1959. In 1950, agricultural operations were defined to include every place of 3 or more acres, whether or not the operator considered it a farm, and every place having "speclalized operations", regardless of the acreage. "Specialized operations" referred to nurseries and greenhouses and to places having 100 or more poultry, production of 300 or more dozen eggs in 1949, or 3 or more hives of bees. In all of the three last censuses, as a result, questionnaires were filled for a considerable number of places that did not qualify as farms. The determination as to which questionnaires represented farms was made during office processing operations and only those questionnaires meeting the criteria for a farm were included in the tabulations.

For both the 1950 and 1954 Censuses of Agriculture, places of 3 or more acres were counted as farms if the annual value of agricultural products, whether for home use or for sale but exclusive of home-garden products, amounted to $\$ 150$ or more. Places of less than 3 acres were counted as farms only if the annual sales of agricultural products amounted to $\$ 150$ or more. A few places with very low agricultural production because of unusual circumstances, such as crop failure, were atso counted as farms if they normally could have been expected to meet the minimum value or sales criteria.

In the censuses from 1925 to 1945 , enumerators were given a definition of "farm" and were instructed to obtain reports only for those places which met the criteria. According to this definition, farms included all places of 3 or more acres, regardless of the quantity or value of agricultural production, and places of less than 3 acres if the value of agricultural products, whether for home use or for sale, amounted to $\$ 250$ or more. Because of changes in price level, the $\$ 250$ minimum resulted in the inclusion of varying numbers of farns of less than 3 acres in the several censuses taken during this period. Generally, the only reports excluded from tabulation were those taken in error and those showing very limited agricultural production, such as only a small home garden, a few fruit trees, a suall flock of chickens, etc. In 1945, reports for places of 3 acres or more were tabulated only if at least 3 acres were in cropland and/or pasture or if the value of products in 1944 amounted to at least $\$ 150$.

The decrease in the number of farms in 1950 and 1954, as compared with earlier censuses, was partly due to the change in farm definition, especially with respect to farms of 3 or more acres in size. Some of the places of 3 or more acres that were not counted as farms in 1950 and 1954 because the value of their agricultural production was less than $\$ 150$ would have qualified as farms if the criteria had been the same as in earlier censuses.

For 1959, the decrease in the number of farms as compared with all prior censuses resulted partly from the change in farm definition. The fact that sales of agricultural products in 1959 was used resulted in the excluslon of some places that would have qualified as farms had the value of agricultural products alone been considered. The increase in the acreage minimum also had an effect. The reduction in the number of farms due to change in definition, 1954 to 1959, Is shown for each county in county table 1 . Some characterlstics of the places not counted as farms in 1959, but which would have been included in 1954, are shown in State table 10.

The change in farm definition made in 1950 and again in 1959 had no appreciable effect on the totals for livestock or crops because the places affected by the change ordinarily accounted for less than 1 percent of the totals for a given county or State.

For the States that comprise the conterminous United States, two figures are published for each county on the number of farms

In 1959. One is an actual count of all farms and the other is an estimate based on the number of farms included in the sample. For almost every county there is a difference between the actual number of farms and the estimated number of farms. Because of sampling procedure and sampling variability, the number of farms in the sample seldom agrees exactly with the actual number of farms. For most counties, the actual number of farms in the sample was either more or less than precisely 20 percent of all farms. Similarly, totals estimated on the basis of data for the sample farms may be slightly more or slightly less than the actual totals that would have been obtained had the data been tabulated for all farms. Therefore, the estimated number of farms reporting certain items may, in some instances, be greater than the total number of farms shown in county table 1 . However, the estimated number of farms is given in county tables 5 and 6 so that estimates based on the sample farms may be related to the estimated rather than the actual number of farms.
Farm Operator.-The term "farm operator" is used to designate a person who operates a farm, either doing the work himself or directly supervising the work. He may be the owner, a member of the owner's household, a hired manager, or a tenant, renter, or sharecropper. If he rents land to others or has land worked on shares by others, he is considered as operator only of the land which be retains for his own operation. In the case of a partnership, only one partner is counted as an operator. The number of farm operators is considered to be the same as the number of farms.
Farms Reporting or Operators Reporting.-Figures for farms reporting or operators reporting, based on a tabulation of all farms, represent the number of farms, or operators, for which the specified item was reported. For example, if there were 1,922 farms in a county and only 1,465 had chickens 4 months old and orer on hand at the time of enumeration, the number of farms reporting chickens would be shown as 1,465 . The difference between the total number of farms and the number of farms reporting a partlcular item represents the number of farms not having that item, provided a correct report was received for all farms.
Where applicable, figures may be given for the number of farms or operators not reporting items that were intended to be obtained for all farms; for example, residence of farm operator, State table 4. The number not reporting, as compared with the total number of farms or operators, indicates the extent of incompleteness of the reporting of the data for the item.
Land Area.-The approximate total land area of States and counties as renorted for 1959 is, in general, the same as that reported for all censuses beginning with 1940. Such differences as are shown reflect political changes in boundaries or actual changes in land area caused by changes in the number or size of reservoirs, lakes, streams, etc. For Alaska, the areas for election districts represent the gross area of land and water.

Land In Farms.-Except for managed farms, the land to be included in each farm was determined from the answers to questions about the number of acres owned, the number of acres rented from others or worked on shares for others, and the number of acres rented to others or worked on shares by others. The acres owned and the acres rented from others or worked on shares for others were first added together and then the acres rented to others or worked on shares by others were subtracted. The result represented the number of acres in the farm. The number of acres in a managed farm was the difference between the total land managed and that part of the managed land that was rented to others or worked on shares by others.

In the 1959, 1954, and 1950 censuses, enumerators were instructed to record total figures for land owned, land rented from others, and land managed for others, including any part of the land that was rented to others. In censuses prior to 1950 , enu-
merators were instructed to exclude all land rented to others and to record only that portion of the acreage owned, rented from others, or managed for others that was retained by the farm operator. Thus, the figures for the individual tenures of land are not entirely comparable for all censuses. However, the land included in each farm was determined on essentially the same basis for all censuses.

The acreage designated in the tables as "land in farms" consists primarlly of "agricultural" land-that is, land used for crops and pasture or grazing. It also includes considerable areas of land not actualls under cultivation nor used for pasture or graz. ing. For example, the entire acreage of woodland and wasteland owned or rented by farm operators is included as land in farms, unless it was being held for nonagricultural purposes or unless the acreage was unusually large. For 1959 and 1954, if a place had 1,000 or more acres of woodland not pastured and wasteland, and if less than 10 percent of the total acreage in the place was used for agricultural purposes, the acreage of woodland not pastured and wasteland was reduced to equal the acreage used for agriculture. The procedure used in 1950 for excluding unusually large acreages of woodland not pastured and wasteland differed slightl, from the one used in 1950 and 1954 . In 1950 , adjustments were made in places of 1,000 or more acres $(5,000$ or more in the 17 Western States), if less than 10 percent of the total acreage was used for agricultural purposes.

Except for open range and grazing land used under gorernment permit, all grazing land was to be included as land in farms prosided the place of which it was a part was a farm. Grazing land operated by Grazing Associations was to be reported in the name of the person chiefly responsible for conducting the business of the Association. Land used rent free was to be reported as land rented from others. All land in Indian resersations that was used for growing crops or grazing livestock was to be included. Land in Indian reservations that was not reported hy indiridual Indians and that was not rented to non-Indians was to be reported in the name of the cooperative group that used the land. In some instances, an entire Indian reservation was reported as one farm.

Land owned.-All land that the operator and/or his wife held under title, purchase contract, homestead law, or as heir or trustec of an undivided estate at the time of enumeration is considered as owned.

Land Rented from 0thers.-This item includes not only land that the operator rented or leased from others but also land he worked on shares for others and land he occupied rent free. Grazing land used under gevernment permit or license is not included.

Land Rented to Others.-This item includes all land rented or leased to others, except land leased to the government under the Soil Bank, and all land worked by others on shares or on a rent-free basis. For the most part, the land rented to others represents agricultural land but it also includes land rented for residential or other purposes. The tenant or sharecropper is considered as the operator of land leased, rented, or worked on shares even thongh his landord may supervise his operations. The landlord is considered as operator of onls that portion of the land not assigned to tenants or croppers.

Land Managed.-This item includes all tracts of land man. aged for one or more employers bs a person hired on a salary basis. A hired manager was considered to be the operator of the land he managed since he was resononsible for the agricultural operations on that land and frequently sujervised others in performing those operations. Managed land was always to be reported on a separate questionnaire whether or not the manager also operated a farm on his own account.

Land in Two or More Counties.-An individual farm was alwars enumerated in only one connty, even in cases where the land was located in two or more comities. If the farm operator lived on the farm, the farm was enmmerated in the county where he lived. If he did not live on the farm, the figures for the farm were talabated for the count where the farm headquarters was lowated. In eases where there was any question as to the location of the headmuarters, fimbes for the farm were tabulated fur the county where most of the land was located.

Land in Farms According to Use. Land in farms has been distributed according to the way in which it was used in 1959. The land uses described in the following paragraphs are mutually exclusive; that is, each acre of land is included only once even though it may have had more than one use durlng the year.

Cropland Harvested.-This category refers to all land from which any crops were harvested in 1959 , whether for home use or for sale. It includes land from which hay (including wild hay) was cut and land in berries and other small fruits, orchards, vineyards, nurseries, and greenhouses. Matured crops hogzed off or grazed were considered to have been "crops harvested" and were reported here. Land from which two or more crops were harvested in 1959 was to be counted only once in the land-use classification. Land used for other purposes either before or after the crops were harvested was to be reported as cropland harvested, without regard to the other uses.

The enumerator was instructed to check the figure for cropland harvested for each farm bs adding the acreages of the individual crops and subtracting the acreages from which two or more crops were harvested. This cbecking procedure was repeated during the office processing of questionnaires for all farms having 100 or more acres of cropland barvested.

Cropland used only for Pasture.-This land-use classification includes rotation pasture and all other land used only for pasture or grazing that the operator considered could have been used for crops without additional improvement. Enumerators were instructed to include land planted to crops that were hogged off, pastured, or grazed before maturity but to exclude land pastured hefore or after hay or other crops were harvested from it. Permanent open pasture may have been reported either for this item or for "other pasture" depending on whether or not the operator considered it as cropland.
The figures for 1945 and earlier censuses are not entirely comparable with those for the last three censuses. For 1945 , the figures include only cropland used solely for pasture in 1944 that bad been plowed within the preceding seven years. The figures for 1940,1935 and 1925 are more nearly comparable with those for 1959,1954 , and 1900 , however, because they include land pastured that could have been phowed and used for crops without additional clearing, draining, or irrigating.
Cropland not Harvested and not Pastured.-This classification represents a total of three subclasses for the 17 Western States and two subclasses for other States.

Cultivated Summer Fallow.-This subclass of land is shown only for the 17 Western States. It refers to cropland that was plowed and cultivated but left unseeded for the 1959 harvest in order to control weeds and conserve moisture.

Soil Improvement Grasses and Legumes.-. For the 1ana census. land used only for cover (arons to eontrol erosion or to be plowed under for sreen manure is tabulated separately from "other "r"pland". After the establishment of the Soil Bank. land that would normally have been nsed for other purpses was fremuntls phated to soil-improvement crops. In counties where large arraces were placed in the soil Bank, the total of land used for soil-improvement crops plus "other cropland" may le considerabls larger than the "other cropland" shown for previous censuses.

Other Cropland.-This subclass includes ide cropland, iand in crops intended for harvest after 1959, and cropland not harvested because of complete crop failure, low prices, labor shortage, or other reasons. The 1959 figures for "other cropland" are not entirely comparable with those for previous censuses since thes do not include land used only for soil-improrement crops. (See preceding paragraph.)
Woodland Pastured.-This classification includes all woodland where livestock were pastured or grazed in 1959. The instruction on the questionnaire-"Include as woodland all wond lots and timber tracts: cutover and deforested land which has value for wond products and has not heen improved for pasture"-represents a somewhat more precise deflnition than the corresponding instruction contained on the 1954 questirmnaire. No definition of woodland was given in 1950 apart from an instruction to enumerators not to include brush pasture as woodland. Some of the changes in woodland aereages from one census to another may merety represent differences in interpretation as to what constitutes "woodland."
Woodland not Pastured.-This classification refers to all woodland not used for pasture or grazing in 1959, including land in mperated farms that was placed in the Soil Bank and planted to trees. Unusually large tracts of timberland that were reported as woodland not pastured were excluded from
the tabulation of land in farms when It was evident that such land was held primarily for nonagricultural purposes.

Other Pasture.-This classification refers to all land other than woodland and cropland that was used only for pasture or grazing in 1959. It lncludes noncrop open or brush pasture and cutover or deforested land that has been lmproved and used for pasture. The figures for the last three censuses are comparable but those for 1945 lnclude all nonwoodland pasture that had not been plowed during the preceding seven years. For the 1940 censns and earller years, the figures are more nearly comparable wlth those for the last three censuses. However, the classification may be somewhat less inclusive because land that could bave been plowed and used for crops wlthout additional clearing, draining, or Irrigating was classlfied as plowable pasture and included with "cropland used only for pasture".

Improved Pasture.-This subclass refers to that portion of "other pasture" on which one or more of the following practices had been used: liming, fertilizing, seeding, irrigating, draining, or the clearing of weed or brush growth. The figures are comparable with those for 1954, when the question on improved pasture was asked for the first time.
other Land.-This classification refers to all land not included in the preceding land-use classlfications, such as house lots, barn lots, lanes, roads, ditches, land area of ponds, and wasteland. This figure for 1959 was obtained from the machine tabulations by subtractlng the total of all other uses from the total land in all farms reported for a given county or classification. Hence, there is no figure given to represent the farms reporting this item.
Value of Land and Bulldings.-Only average values of land and buildings per farm and per acre are presented in this report. They are estimates based on data obtained for sample farms. Estimates of the total value of land and buildings by States, geographic divisions, and the United States, are presented in volume II.

The enumerator was instructed to record the market value of the land and the buildings on that land. Market value was defined as the price whlch the farm operator would expect to receive for the land and bulldings if he were to sell them on the day of enumeration.

More problems and difficultles arise in the enumeration of farm-real-estate values than in the enumeration of most other agricultural items. Most of the Items enumerated require the respondent to make a statement of fact. For example, information about the number and ralue of farm anlmals sold alive during the year is based on actual transactions. Similarly, information about livestock inventories relates to the situation existing on a specific place at a specific time. Reports concerning the value of land and buildings, however, are estimates based almost entlrely on opinion. The majority of farms have not changed hands for many years and are not currently for sale. For such farms, the operators are not likely to have any clear basls for estimating the value. To make an intelligent and objective estimate, a respondent first needs to make an estimate of the prevailing average market value of farms in his communlty. Then, he must elther add to or subtract from that estimate to allow for the different characteristics of his own farm. In many cases, an operator who would not sell his farm under any clrcumstances may report an unreasonably high market value. In other cases, a farm operator who acquired bis real estate during a period of relatively low prices may estimate an unrealistlcally low value by current standards. Because of the extent of variation that is known to exist in real estate values, It ls difficult to devise checking procedures that will identify inaccurate estimates.

Age of Operator.-Farm operators were classified by age into six age groups. The average age of farm operators was derived from the sum of the ages of all farm operators reporting age dlvided by the number reporting. The number of farm operators 65 or more years of age is an actual count based on the operators reporting age.

Residence of 0perator.-Farm operators were classilied by residence according to whether or not they lived on the farms they were operating. Some of those who did not live on the farms they operated themselves lived on farms operated by others. In cases where all the land was rented from others or worked on shares for others, the operator was considered to live on the farm operated provided the dwelling he occupled was included in the rental agreement. The dwelling, in such cases, was not necessarily on the land being operated. Similarly, a farm operator who did not llve on the land being cultivated or grazed but who had some agricultural operations (other than a home garden) at his dwelling was considered as living on the farm operated.

Since some farm operators live on their farms only during a part of the year, comparability of the figures for various censuses may be affected by the date of enumeration.

In a few cases, the enumerator failed to report the residence of the farm operator. Differences between the total number of farms and the number of farm operators classified by residence Indicate the extent of under-reporting.

Year Began Operating Present Farm.-Enumerators were instructed to report the year during which a farm operator began to operate his present farm and, if the year was 1958 or later, also to report the month. The year was intended to refer to the first year of the period during which the onerator had been in continuous charge of his present farm or of any part of it. The tlme of year that farmers move ls indlcated by the month they began operating their farms, as shown by a monthly breakdown of the reports for farmers who began operating their present farms during 1958 and 1959.

Off-Farm Work and Other Income.-To obtain a measure of the extent to which farm operators rely on nonfarm sources for part of thelr income, four questions were asked of all farm operators. The first question asked for the number of days the operator worked off his farm in 1959. The other three questions, to be answered "Yes" or "No," asked (1) whether other members of the operator's household did any work off the farm ; (2) whether any lncome was recelved from sources other than the sale of agricultural products from the farm operated; and (3) whether the combined lncome of all members of the housebold from off-farm work and other sources was greater than the total value of agricultural products sold from the farm operated.

Off-farm work was deflned to include work on someone else's farm for pay as well as all types of nonfarm jobs, businesses, and professions, whether the work was done on the farm premises or elsewhere. Exchange work was not included.

The questions asked in the 1959 Census are closely comparable with those asked in 1954 . The data for 1959 are actual totals of all operators reporting off-farm work and other income whereas those for 1954 are estimated totals based on the sample.

Equipment and Facilities.-In 1959 as in several earller cen. suses, data about specified equipment and facilities were obtalned for only a sample of farms. Farm operators were asked to report equipment and facilities that were on the farm at the time of enumeration, regardless of ownership. They were to lnclude items that were temporarlly out of order but not any that were worn out.

Data $\ln$ terms of actual number were obtained for the following items of farm equipment in 1959: (1) grain combines, (2) corn pickers, (3) plek-up balers, (4) field forage harvesters, (5) motortrucks, (6) wheel tractors, (7) garden tractors, (8) crawler tractors, and ( 9 ) automobiles. Definitions given enumerators included the following speclfications, among others: Corn pickers related to all types of machines used for picking corn, whether used in separate or in combined picking-shelling operations. Pick-up balers were to Include both hand-tie and automatic baters but not statlonary ones. Motortrucks were to include pick-up trucks and truck-trailer combinations; jeeps and station wagons
were also to be inciuded if they were used primarily as trucks, but school buses were specfically excluded. Wheel tractors specifically excluded garden tractors, lmplements with built-in power unlts, such as self-propelled combines or powered buck rakes, and the power unlt of a truck-trailer combination. Automobiles were to include jeeps and station wagons if they were used prlmarlly as passenger cars.

Questions to be answered "Yes" or "No" provided information as to the presence or absence of the following items: (1) teiephone, (2) home freezer, (3) milking machine, (4) electrlc milk cooler, (5) bulk-type milk cooler (in six States only-Michigan, Minnesota, New York, Ohlo, Pennsylvania, and Wisconsln), (6) crop drler and (7) power-operated elevator, conveyor, or blower.

Comparable data from one census to another are not avallable for all items. The questions asked about equlpment during a glven census reflect changes in farm mechanization and in the facilities available to farm familles. Questlons about some items of equlpment were asked in 1959 for the first time (electric milk cooler, crop drier, bulk-type milk cooler, etc.). Similarly, some questlons that were asked in earlier censuses were omitted in 1959. For example, the use of eiectriclty is now so widespread that there is no longer any need for obtainlng a count of the farms having it.

Farms by Kind of Road.-The classlfication of farms by the kind of road on which they are located is based on only a sample of farms. The enumerator was instructed to report, on the basis of his own observation, the kind of road on which the most frequently used entrance to the farm was located. For farms consistlag of two or more tracts, he was to iimit his report to the tract on which the farm operator had bls dweliing or other headquarters.

Farm Labor.-The questions about farm labor were asked only for the sample farms and related to persons working during the calendar week preceding the week of enumeration. Since the enumeration starting dates varled by geographic areas, and the enumeration wlthin each area lasted over a perlod of several weeks, the calendar weeks to which the data apply also vary. Thus, the data for an individual farm may relate to any one week during the months of October, November, or December, or even, In a few Instances, to weeks during September 1959 or January 1960.

Farm labor was defined to include any work, chores, or planning necessary to the agricultural operations of the farm ; and to exclude housework, contract construction work, custom machine work, and repair, installation, or construction work done by persons employed specifically for such work. The farm labor informatiou contained in this report represents estimates based on answers to questions relating to the farm work or chores done during the week by (1) operator, (2) unpaid members of the operator's family, and (3) hired persons. An operator was considered as working if he worked one or more hours; unpaid members of the operator's famlly, if they worked 15 or more hours; and hired persons, if they worked at all during the week.

Data are not fully comparable from one census to another, primarlly because of differences in the period to whlch they relate. In 1954, the data were purposely related to either one of two calendar weeks, depending in part on the starting date set for the enumeration and in part on which week represented a period of peak employment within a given State. For the majority of States, the perlod specified was the week of September 26-October 2 ; for other States, the week of October 24-30.

In 1950, as $\operatorname{In} 1959$, the data related to the week preceding the actual enumeration. Unllke 1959, however, enumeration starting dates were identlical for all States in 1950 (April 1) but since several weeks were required to complete the enumeration, the calendar week preceding the enumeration was not identical for
all farms. In 1945 and 1935, the number of farm workers related to the first week in January and, in 1940, to the iast week in March. In 1945, 1940, and 1935, only persons working the equivalent of two or more days during the specified week were to be included. In 1945 and 1940, an additional speciffeation limited the workers to those 14 years old and over.
Experience gained from earller censuses indicates that farm labor data are often unsatisfactorily reported unless the week spectifed is the week immediately preceding the actual enumeration. When a farm operator was asked to report the number of persons employed during a specified week that was several weeks prior to enumeration, he often reported the blghest number of persons employed during the year. Obviously Incorrect reports were adjusted to make the data reflect more nearly the situation known to exist during the specified week. The farm labor data for 1954 relates to a specified week which, in some cases, was sereral weeks prior to enumeration. Few adjustments were made in those data, however, even though there were indications of incorrect reporting.

Regular and Seasonal Workers.-Hired persons working on the farm during the week concerned were classed as "regular" workers lf the period of actual or expected employment was 150 days or more during the year. They were classed as "seasonal" workers if the period of actual or expected employment was less than 150 days. In cases where the period of employment was not reported for an individual farm, it was estimated from data for such items as basis of payment, wage rates, expenditures for labor in 1959, and type of farming operations.
Hired Workers by Basis of Payment.-Hired persons were also classified according to whether they were paid on a monthly, weekly, daily, or hourly basis, or by piecework. In cases of incomplete reporting, the basis of payment for bired workers was supplied during the office processing operations.

Wage Rates and Hours Worked.-The agreed cash rate of pay was asked for each class of hired worker except those employed on a piecework basis. (The number and the earnings of persons paid on a piecework basis were required for those who worked on Friday of the week preceding the enumeration.) The number of hours that workers were expected to work to earn their pay was asked for each class except those employed on an hourly or piecework basis. For 1959 and 1954, the data include office estimates for farms subnritting incomplete reports of wage rates and hours worked. The estimates were consistent with the size and type of operations for the individual farm as compared with similar farms in the area for which complete reports were received. The corresponding data for 1950 apply only to farms that reported both wage rates and hours worked.
Fertilizer and Lime.-The questions about fertilizer and lime, asked only for the sample farms, relate to the acreage on which fertilizer and lime were used and to the quantity used. Farm operators were asked to report total quantities used in 1959 on the farms they operated regardless of when or by whom the fertilizer and lime were purchased. In the South, some landlords who operated farms themselves included the fertilizer and lime they had purchased for use on their tenant-operated land. Such fertilizer and lime may also have been reported by the tenants. When double reporting was detected during the editing process, the data on the questionnaires concerned were adjusted to elimInate dupllcation in the totals.

The 1959 data for fertilizer and lime are entirely comparable with those for 1954. A breakdown between dry and liquid fertilizing materials was not obtained in $195 t$ and data on cost of either fertilizer or llme were not obtained in 1959.

Fertllizer.-The report for fertilizer was to refer only to commercial fertilizer and fertilizing materials, including rock phosphate. The acres fertilized and the tons of fertilizer applied to those acres were obtained separately for selected crops. The selected crops varied by region so that it was possible to obtain detailed data for the crops most commonly fertilized in each region. In cases where the same land was used for more than one crop, the acres fertilized were to be reported separately for each crop. If the same crop was fertilized more than once, however, the acres in that crop were to be reported only once. In all cases, the total quantity of fer-
tilizer used in 1959 was to be reported, including quantities used on land occupied by crops planted in 1958 or by crops to be harvested in 1960 .

Reports for quantity of fertilizer and fertilizing materials used were required for both dry and liquid materials. The terms "dry" and "liquid" referred to the form in which the fertilizers and fertilizing materials were purchased and not to the way in which they were applied. Thus, dry fertilizers were those purchased in dry or solid form, as powders, dusts, granules, pellets, etc.; liquid fertilizers were those purchased in fiuid form, as solutions or as liquefled gases.

Iime.-The data for lime relate to the total acreage limed in 1959 and the total tonnage of lime and llming materials used on those acres for purposes of conditioning the soil. Instructions on the questionuaire stated that ground limestone, hydrated and burnt lime, marl, and oyster shells were to be lncluded but that lime used for sprasing or sanitation purposes was to be omitted.

For some counties, the tonnage of lime shown in the table may be less than the tonnage reported for the Agriculture Conservation Program or the Conservation Reserve Program of the Soil Bank. Differences may be due either to sampling error or to under-reporting by farm operators. Many of the differences are minimized or eliminated entirely in the data presented on a State or regional basis.
Specifled Farm Expenditures.-The data for farm expenditures are estimates based on reports obtalned from the sample farms. The 1959 questionnaire contalned questions for six items of farm expenditure: (1) purchase of feed for livestock and poultry, (2) purchase of llvestock and poultry, (3) machlne blre, (4) hired labor, (5) seeds, bulbs, plants, and trees, and (6) gasollne and other petroleum fuel and oil. With the exception of items (2) and (5), exactly the same questions were asked in 1954. For each item specified, the total expenditures made for the farm in 1059 were to be reported, whether made by the farm operator, his landlord, or both. A farm operator who rented part of his land to others was to report only the expendltures for the land he operated himself. Enumerators were instructed to ask respondents who bad difficulty estimating their expenses for the period between enumeration and the end of the gear to estimate them on the basis of current costs.

Feed.--The report on feed purchased for lirestock and poultry was to include expenditures for grain, hay, millfeeds, pasture, salt, condiments, concentrates, and mineral supplements as well as for the grinding and mixing of feed. The estimated cost of items furnished by a landlord, contractor, or other owner for feedlng poultry and livestock kept on the farm was also to be included. Payments made by a tenant to his landlord for feed grown on the tenant farm were to be excluded.

Livestock and Ponltry.-The cost of babs chicks and turkey poults was to be included in the expenditures made for the purchase of livestock and poultry. Enumerators were instructed to ask the farm operator to include the cost or estimated purchase value of poultry and livestock provided by others and cared for by the operator under a contract feeding arrangement. The cost of livestock purchased for resale within 30 days was not to be included. A short-term transaction of that nature was considered to be a dealer operation, not an agricultural one.

Data on the purchase of livestock and poultry were not obtained in 1954. The instructions for the 1950 census specified that expenditures for domestic rabbits, fur-bearing animals kept in captivity, and bees were to be included. Any lack of comparability in the 1950 and 1959 data resulting from incluelon or exclusion of rabbits, fur-bearing animals, or bees is consldered to be so slight as to be insignificant.

Machine Hire.-Expenditures for machine hire relate to custom machine work, such as tractor hire, threshing, grain or seed comblning, silo filling, baling, cotton picking, cotton ginning, corn picking, plowing, vegetable harvesting, fruit pleking, spraying, and dusting. Any amount spent for the labor included in the cost of machine hire was to be considered as part of the total expenditure. The cost of freight or trucking and exchange work without pay were to be omitted.

Hired Labor.-Expenditures for hired labor were to include total cash payments made in 1959 to famlly members and to others for farm labor. Payments to persons supplied by a contractor or a cooperative organization and paid directly by them or by the crew boss were also to be lncluded. Payments
for the following types of work were to be excluded: housework, contract construction work, custom machlne work, and repair, installatlon, or construction work done by persons speclfically employed for such work.

Gasoline and Other Petroleum Fuel and Oil.-Expendltures for gasoline and otlier petrolenm fuel and oil were to relate only to the products used in the farm business. Enumerators were instructed to exclude the cost of petroleum products used for the family automoblle when operated for other than farm business purposes and of products used $\ln$ the farmhouse for heatlng, cooking, and lightlng.

Seeds, Bulbs, Plants, and Trees.-Expenditures were to represent the total amount spent for seeds, bulbs, plants, and trees to be used on the farm operated. The value of seed grown on the farm was to be excluded. For nurserles and greenhouses, the cost of products purchased for lmmediate resale was also to be excluded.

Thls item of expenditure was not included In the 1954 Census. The data are comparable with those for 1950 , however.

## Caops

Crops Harvested.-The 1959 agriculture questionnaire was simllar to the questionnalre used in several previous censuses in that it provided for the collection of detailed data for all crops harvested on each Individual farm. The variation in the erops listed on the questionnalres used $\ln$ different States made possible the separate reportling of all important crops grown in a given area. All verslons of the questlonnalre contained beveral "All other crops" questions where crops not apeclfically listed in separate questlons were to be reported.

Acreage of Crops Harvested.-In most Instances, the acreage reported for individual crops represents the area harrested during 1959. The area harvested is often leas than the area planted. For fruit orchards and groves, vlneyards, and planted nut trees, the acreage reported represents the total area ln both bearing and nonbearing trees and vines as of the date of enumeration-usually a date In October, November, or December 1959. For boybeans, cowpeas, and peanuts, the acreage grown for all purposes was reported as well as the acreage harvested for specific purposes. For velvet beans, only the acreage grown was reported. As the enumeration was about to begin in South Florida (those counties in whlch the enumeration was begun on October 7), an Instruction was Issued to the effect that the data for vegetables and potato crops should relate to a full year, beginning on October 1, 1958, and ending September 30, 1959.

Quantlty of Crops Harvested.-Except for cltrus frults, ollves, avocados, and for vegetable and potato crops in South Florida (see precedlng paragraph) data for quantly harvested relate to the calendar year 1959 . For citrns frults, the quantity harvested from the bloom of 1958 for the $1958-59$ marketing season was to be reported. For olives, the crop harvested in 1959 was to be reported for all States except Californla and Arizona. Enumeratore in those two States were instructed to report ollves harvested from the bloom of 1958 during the 1958 59 harvest season (September 15, 1058, to February 28, 1959). In the case of avocados, the data for California were to relate to the quantity harvested from the bloom of 1958 for the marketing season that extended from October 1, 1958 to September 30, 1959; the data for Florlda were to relate to the crop harvested for the marketing season that extended from July 1, 1959, to February 28, 1960 . Respondents were to estimate quantlies not yet harvested at the time of enumeratlon.

Unlt of Measure.-The unlt of measure ln whlch quantities were to be reported has varied for some crops, not only from State to State, but also from census to census. The aim has been to permit reporting in the units of measure currently In use. In the State and county tables, the quantlites harvested for each crop are usually expressed in the unlt of measure given on the 1959 agriculture questionnaire. In 1959, for corn and Irish potatoes, a choice between two units in whlch to report the production was given ln some States. (See the discussion for those crops.) To provlde readlly comparable Information, data published in earlier reports in different units of measure generally bave been converted to the units used in 1959.

Corn.-In the 1959 census, detalled questions regarding the purpose for which corn was harvested were asked in all States. For moat States, bushels was the only unit specified for corn
for grain. In some areas, however, where farmers were not accustomed to using bushels as the unlt of measure, the questionnaire contalned a provision for the quantity of corn for graln to be reported either in bushels (shelled basis) or in baskets of ear corn. As in former censuses, some reports were recelved in units of measure other than bushels or baskets. Prior to tabulation, all reports were converted to bushels (shelled basls) on the basis of the following factors: 70 pounds of ear corn, 2 baskets of ears, or 56 pounds of shelled corn equal one bushel. A barrel of ear corn was usually considered equal to 5 bushels of shelled corn.

Annual Legumes.-For soybeans, cowpeas, and peanuts, the acrea and quantly grown or harvested for specific purposea, as well as the total acreage grown for all purposes, were obtained for areas where these crops are grown extensively; for velvetbeans, only the total grown for all purposes was obtained. For all these crops except, possibly peanuts, the total acreage grown for all purposes includes some acreage that was plowed under for green manure. In a few Southern states, separate figures were obtalned for the acres grown alone and the acres grown with other crops. In 1959, as in 1954 , enumerators were lnstructed to report green sogbeans and blackeyes and other green cowpeas harvested for sale as vegetables and not as annual legumes.

Hay Crops.-Data for the total acres of land from which hay was cut exclude the acreage in sorghum, soybean, cowpea, and peanut hays. These crops were reported in separate questions In the States where they are important. To obtain the total acres from which other hays were cut, the acres of the various hay crops, including grass silage, were added together for each county. The corresponding totals for 1954 were obtained by the same procedure. For the 1950 census, however, the totals were based on farmers' own reports of their total acreage in harvested hay crops.

The questionnaire contained an instruction that if two or more cuttings were made from the same land, the total production from all cuttings was to be reported but the acres cut were to be counted only once. In cases where both hay and grass silage were cut from the same land, the total acreage was to be reported for both crops. In 1959 , as in 1954 , alfalfa hay included alfalfa and alfalfa mixtures for hay and for dehydrating; clover and timothy hay lncluded clover, timothy, and mixtures of clover and grasses; small grain hay included oats, wheat, barley, rye, or other small grains cut for hay. The hay crops listed on the questionnalre varied somewhat from one State or region to another. The kinds of hay to be included in separate questions can be determined for a specific State from reference to the facsimile of the questionnaire that is in the appendlx.

The tonnage of hay, lncluding alfalfa hay for dehydrating, is given on a dry-weight basis. Prior to tabulation, production reported in green weight was converted to its dry-weight equivalent by divlding by 3 . However, the production of grass silage ls given ln terms of green weight.

Field seed Crops.-The field seed crops listed on each version of the questlonnaire were limited to those considered most important wlthin the given State. Each version of the questlonnalre contained space for listing other field seed crops in order to facilltate the reporting of all field seed crops harvested. Quantity harvested was to be reported In terms of clean seed for most field seed crops. Bluegrass, or Junegrass seed, was to be reported in terms of green seed for Iowa, Kansas, Kentucky, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Tennessee. No mentlon was made of "green-weight basis" for other States where this crop was to be reported in the "All other" question.

Irish Potataes and Sweetpotatoes.-For Irish potatoes and sweetpotatoes (including yams), the total quantity harvested was to be reported for each crop in all cases, whether harvested for
home use or for sale or whether used for livestock feed. The acreage harvested was to be reported for each crop only in cases where the quantity amounted to 20 or more bushels (or the approximate equlvalent in terms of hundredweights, barrela, or pounds, as explalned on different versions of the questionnaire). This method of reporting was designed to facllitate the enumeration of potatoes harvested on small plots for home use. Bssentially the same procedure was followed in both 1954 and 1950. In earlier censuses, however, the acreage of Irish potatoes and sweetpotatoes was to be reported ln all cases, even when production was solely for home use. Therefore, the data on acres for censuses prior to 1950 are not fully comparable with those for the last three censuses, especiaily in countles or States where production ls largely for home use.

The unlt of measure in whlch quantity was to be reported varied from one State or region to another to correapond with the units most commonly used in a glven area. In 27 States, the questlonnalre provided a choice for reporting either buabels or 100 -pound bags (hundredweights). The publlshed data for counties and States are in terms of bushela.

Berries and Other Small Fruits.-The question for berries and other small fruits related specifically to the acreages and quantitles harvested for sale. Only tame or cultivated berriea were to be reported except for the New England States, where wild blueberries were also to be included. Enumerators were instructed always to report the total quantlty of each kind of berry harvested for sale but to report the area harvested only when it amounted to one-tenth acre or more. Nonbearing areas and areas and quantities harvested for home use were to be excluded. The data for 1959 and 1954 are fully comparable.

Tree Fruits, Nuts, and Grapes.-In 1959, as in 1954, fruit trees, nut trees, and grapevines were not enumerated for farms having a combined total of less than 20 at the time of enumeration. Both bearing and nonbearlng trees and vines were to be included but not any that had been abandoned. For censuses prior to 1954, all fruit or nut trees and grapevines on the farm were to be enumerated, regardless of the number. Because of thia change in enumeration procedure, the data for 1959 and 1954 are not fully comparable with those for earlier cenauses. In commercial fruit-producing counties, the change in procedure may have had a conslderable effect on the number of farms reporting without causlng any algnlficant changes in the number of treea and vines nor in the quantity harvested. In counties where most of the trees or vines are in amall plantinga and where production is largely for home-use, however, the change may have caused a significant reduction not only in the number of farms reporting but also in the number of trees and vines and in the quantity harvested.

In both 1959 and 1954, the area in fruit orchards, grovea, vineyards, and planted nut trees was enumerated when there were 20 or more fruit trees, nut trees, and grapevines. In 1950 , the corresponding area was enumerated only if it amounted to one-half acre or more. In censuses prior to 1950, the area was to be reported regardless of its size or of the number of trees and vines. Enumerators frequently omltted the fractional acreages $\ln$ small plantings and home orchards, however. In some counties, small plantings or home orchards comprise a aizeable proportion of the total frult and nut acreage. For those counties, the change from one census to another in acreage of land in fruits and nuts may not be due to fact but merely to differences in enumeration.

In 1959, Callfornla was the oniy State for which the acreage in each individual frult and nut crop was obtained. In 1954, such acreage was also obtalned for Arlzona. In all States, the number of bearing and nonbearing trees or vines on the farm at the time of enumeration and the quantly harvested in 1959 were to be reported separately for each frult and nut crop. (Exceptlona in the barvest period for cltrus fruita, avocadoa, and
olives are described on p. XIX.) The unit of measure In which quantities were to be reported varied from one State to another. Tables in this report show quantities in the unit of measure appearing on the 1959 questiounaire used in the State.
Nursery and Greenhouse Products.-The questions about nursery and greenhouse products related only to products grown on the place for saie. Crops bought for resale without additional cultivation were to be.excluded. The area used for growing and the value of sales were to be reported separately for each of three groups, as follows:
a. Nursery products, (trees, shrubs, vines, and ornamentals).
b. Cut flowers, potted plants, florist greens, and bedding plants. For these items, the area grown in the open was to be reported separately from the area grown under glass.
c. Vegetables grown under glass, flower seeds, vegetable seeds, vegetable plants, bulbs, and mushrooms. For these items, the area grown in the open was to be reported separately from the area grown under glass or in the house.
The data obtained for 1959 are comparable with those for 1954 and 1950 since the questions asked were essentially the same in the three censuses. Detailed data regarding the production and sale of nursery, greenhouse, and other horticultural products on farms having sales of $\$ 2,000$ wili be published in volume V, part 1.

Forest Products.-The forest products data obtained in the Census of Agriculture relate only to the products cut on farms. Commercial logging, timber operations, and forest products grown or cut on nonfarm places are excluded. Therefore, the data in this report do not represent the total forestry output or income for a county or State.

The questions included on the 1959 agriculture questionnaire are more detailed than those asked in the 1954 Census. Vaiue was obtained for the sale of standing timber or trees and for the sale of poles and piling, bark, bolts, and mine timbers. The quantity cut, whether for home use or sale, and the quantity sold were obtained for Individual forestry products such as firewood and fuelwood, fence posts, sawiogs and veneer logs. Data relating to pulpwood, Christmas trees, maple trees, and maple syrup were obtained in States where such products are important commercially.

Value of Crops Harvested.-The total value of crops harvested represents the estimated vaiue of all crops harvested during the crop year 1959. It includes the value of quantities consumed on farms as food, feed, seed, etc., as well as quantities sold. Farmers were not asked to report values of crops harvested; the values were calculated in the Processing Office. For individual crops, the quantity harvested was multiplied by the average price at which the crop was sold in the State. State avarage prices were furnished to the Bureau of the Census by the Agricultural Marketing Service of the U.S. Department of Agriculture. They are based on reports received from a sample of farmers and dealers. Quantities harvested were not obtained for vegetables nor for nursery and greenhouse products. Therefore, for those crops, the value of sales, as obtained in the enumeration, was used in the calculation of total value of crops harvested.

Value of Crops Sold.-The questionnaire required value of sales of crops to be reported only for total vegetables, nursery and greenhouse products, and certain forest products. For all other crops, the value of sales was calculated on a county level during processing operations by multiplying the State average prices by either the quantity sold or the quantity harvested. Reports of quantity sold were obtained during the enumeration only for some of the major fleld crops. Quantity harvested was used in the calculation of value of crops sold for such crops as cotton, tobacco, etc., that are customarily grown for sale. The procedures used for the various crops are described on page XXV. They
are simllar to the procedures followed in 1954. In 1950, values of crops sold were obtalned for each farm during the enumeration.

## Ireioation

Definition of Irrigated Land.-Irrigated land is defined as land watered for agricultural purposes by artiflcial means. These means included subirrigation as well as systems whereby water was applied to the ground surface, elther directly or by sprinklers. Land flooded for rice cultivation was considered as irrigated. Land flooded during high-water periods was to be included as irrigated only if water was directed to agricuitural use by dams, canals, or other works. The definition of irrigated land specifleally excluded land where the "water table", or natural level of underground water, was controiled by dralnage works with no additional water brought in by canals or pipes.

Enumeration of Irrigated Land.-A question on total land irrigated was asked In all States, with the exception of Alaska. The acreage reported for this question includes not only irrigated cropland but also any other land that was Irrigated in 1959.
The questionnaires used in the 17 Western States, Louislana, and Hawail included several additional questions regarding irrlgation. These questions related to the acreage of land Irrigated by sprinklers, irrigated land from which crops were harvested, specific crops irrigated, and source of Irrigation water. Such additional data, for irrigated farms, are presented in county table 1a for these States.
Statlstics on the irrigation enterprises which supplied Irrigatlon water were collected in the 1959 census of Irrigation and are published in Volume III, "Irrigation of Agricultural Lands". This report contalns a considerable amount of data about irrigation for the 17 Western States and Louislana.
Irrigated Farms.-All farms reporting any land irrigated in 1959 are counted as irrigated farms.
Land in Irrigated Farms.-Data for land in irrigated farms according to use relate to the entire acreage in these farms, including land that was not irrigated.
Iand Irrigated.-Data for land irrigated relate only to that part of the land in irrigated farms that was watered by artificial means at any time in 1959. Separate figures are given for farms reporting land irrigated by sprinklers whether or not the land was also irrigated by other means. Additional figures are given for farms reporting land irrigated by sprinklers oniy. Data on sprinkier irrigation were not obtained in the 1954 census.

Irrigated Cropland Harvested.-The data for irrigated cropland harvested relate to ali irrigated land from which crops were harvested in 1959, regardless of the method of irrigation. An instruction on the questionnaire reminded enumerators and respondents to include irrigated iand from which hay was cut, irrigated land in both bearing and nonbearing fruit and nut crops, and Irrigated land from which volunteer crops were harvested. Each Irrigated acre was to be reported only once, regardless of how many crops were harvested from it.

Other Irrigated Land.-This classification was obtained by subtraction of the acreage of Irrlgated cropland harvested from the acreage of total land Irrigated. It represents primarily irrigated cropland not harvested and irrigated pasture or grazing land.
Farms Irrlgated By Number of Acres Irrigated.-Ail farms on which any land was irrigated in 1959 are classiffed according to the number of acres lrigated in county table 1a for the 17 Western States, Louisiana, and Hawaii. This classification is based on totai land Irrigated. Therefore, it includes not only the irrigated land from which crops were harvested but also all other Irrigated land, regardless of use.

Land Irrigated By Source of Water.-The agriculture questionnaire contained a question as to what proportion of irrigated water used on the farm in 1959 was obtained from groundwater, surface-water, and irrigation-organization sources. Respondents were asked to report separately the percentage of
water obtained from each source. The number of acres that were irrlgated by water from each source or combination of sources was calculated during office processing operations by applying the percentages to the total land irrigated.
Gronnd-water sources relate to wells (pumped or flowing) and springs; surface-water sources relate to streams, lakes, reservoirs, and sewage and drainage ditches. For each of these sources, only water obtained by pumps or other works operated as part of the operator's own farm or as part of another single farm was to be included. Irrigation-organization sonrces relate to lrrigathon enterprises organlzed to supply water to a group of farms, regardless of how or where the enterprise obtained the water. The irrigation enterprise may be a legal organization or a group of farmers informally organlzed to operate a supply ditch or other works to provide water for their own farms.

## Land-Use Practices

Snmmary Information.-The 1959 data for land-use practices are estimates based on reports obtained from only a sample of farms. Comparable data are not presented for 1954 because questions about land-use practlces were lncluded on the 1954 questionnaire for only a iimlted number of States. The various land-use practices relate to methods for reducing soil erosion, either by improving the soll, controliing the run-off of water, or reducing the blowing of topsoil.
Cropland in Cover Crops.-The data relate to land on which cover crops were turned under for green manure $\ln 1959$ and which was then planted to another crop. The entire acreage of cover crops so used was to be reported even if the following crop falled.

Cropland Used for Grain or Row Crops Farmed on the Contour. This item relates to land on which grain or row crops were planted $\ln$ level rows around the siope of a hill.

Land in Strlp-Cropping Systems for Soil-Erosion Control.-Stripcropping was defined as the practice of alternating close-sown crops with strips or bands of row crops or of alternatling either close-sown or row crops with bands of cultivated fallow land. The publlshed data refer to the total acreage of all fields and tracts in which strlp-cropping was practiced in 1959.

System of Terraces on Crop and Pasture Land.-This item relates to the acreage in ridge-type or channel-type terraces constructed on sloping cropland and pastureland.

## Livestock and Poultry

Inventorles.-Data for llvestock and poultry on farms relate to the number on hand at the tlme of enumeration. All livestock and poultry, including those being kept or fed under contract, were to be enumerated on the farm or ranch where they were, regardless of who owned them. Livestock in transit from one grazlng area to another or grazing in natlonal forests, grazlng distrlcts, open range, or on land used under permit were to be reported as belng on the place where the person who had control over them had hls headquarters.

The tlme of year at whlch livestock and poultry are enumerated affects the data. Therefore, the date of enumeration needs to be considered when totals for the various censuses are compared. Both the 1959 and the 1954 census data represent fail inventorles. These censuses came at a time of large-scale movement of flocks and herds from one range to another, from ranch to feed lot, and from farm or ranch to market.

The censuses of $1920,1925,1935$, and 1945 were taken as of January 1 and those of 1930, 1940, and 1950, as of April 1. A count made in April varies considerably from one made in January. In most areas a large number of animals are born between January and April. A considerable number of older animals die or are sold during the same period. In the range States, along
with the change In season and grazing condition, sheep and cattle are mored from one locality or county to another. This movement may affect the comparability of data for counties and, in some cases, for States. The comparability of data by age has been affected also by changes in the questions from one census to another.

Milk Cows, Cows Milked, Mllk Produced, and Butter.-Data on the number of milk cows, cows milked, and milked produced relate to the day preceding the enumeration. Data for butter churned were obtained only for 14 States and relate to the calendar week preceding the enumeration. The data for cows milked yesterday and milk produced yesterday are not given in this volume. These figures were obtained primarily to serve the needs of the U.S. Department of Agriculture in making monthly and annual estimates of milk production. These figures can be made available, at a small cost, to others who express an interest in them.

Whole Milk and Cream Sold.-Data for whole milk and cream sold relate to the entlre year 1959 and are estimates based on reports obtalned for farms in the sample. Ali milk and cream sold from the farm (except quantitles purchased from some other place and then resold) were to be included, regardless of who shared the receipts. The questionnaire provlded three alternative unlts of measure for reporting the quantity of milk sold-pounds of mllk, gallons of mllk, and pounds of butterfat. The respondent was thus permitted to report quantity according to the unit of measure in which payment was received. In the State and county tables, the data for milk are given in the unit of measure most commonly used in the State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of milk as shown by data furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture.

Sows and Gilts Farrowing.-In the 1959 census, data were obtalned for the number of litters farrowed between December 1, 1958, and June 1, 1959, and from June 1 to December 1, 1959. In the 1954 census, data were obtalned for the sows and giits that farrowed rather than for the number of litters.

Sheep, Lambs, and Wool.-In the 1959 census, questions about sheep, lambs, and wool were asked in all States. Data on shearlngs and on amount of wool shorn were obtained for lambs and sheep separately. In the 1954 census, sheep and lamb inventorles were not obtained for Florida, Georgia, and South Carolina.
Goats and Mohair.-In 1959, questions on goats, kids, and mohair appeared on the questlonnaires for the following nine States: Arlzona, Californla, Mlssouri, Nevada, New Mexlco, Oklahoma, Oregon, Texas, and Utah. In 1954, corresponding data were obtained for Loulsiana, New Mexico, Okiaboma, Oregon, Texas, Washington, and seiected counties in Missouri.

Bees and Honey.-No questions on bees and honey were included on the questionnaires for elther the 1959 or the 1954 census. In 1959, however, enumerators were instructed to obtain agriculture questlonnalres for places not having agricultural operations if they were engaged In beekeeping. The number of bives of bees and the amount of honey sold were to be reported in the "Remarks" space of the questlonnaire. Data for bees and honey are not included in this report.

Value of Livestock on Farms.-To obtain the value of livestock on farms, the number of each class of llvestock or poultry on hand was multiplied by the State average price for 1959 , as furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture. Comparable data for 1954 were compiled by the same method on the basis of average prices for that year.

Sales of Live Animals.- Data for the number and value of animals sold alive in 1959 are estimates based on reports for sample farms only. Corresponding data for 1954 were obtained for all farms. The doilar value of sales was obtained from the farmer
for cattle, caives, and horses and mules. Average value per head for other Ilvestock sold was obtained from the U.S. Department of Agriculture. In the 1959 census, respondents were asked to report separately the number of live animals already sold and the number estimated to be sold between the time of enumeration and the end of the year. This separation of reports for the number sold and to be sold was designed to assure more complete coverage of all livestock sales made during the year. In the 1904 census, only totals for the entire year were obtained though reference was made to animals to be sold between enumeration and the end of the year.
Sales of Poultry and Poultry Products.-For both the 1959 and the 1954 Censuses, sales of chickens were obtained for two groups: (1) broilers and (2) other chickens. The enumeration of broiler sales presents prob'ens arising from the varied contractual arrangements under which broilers are produced. The questionnaire contained an instruction to the effect that all broilers grown for others under contract were to be reported as sold. During office processing operations, the data reported for inventories and sales of chickens four months old and over, chicken eggs sold, and broilers sold were carefully examlned. Obvious inconsistencles indicating confusion between broilers and other chickens were corrected on the basls of estimated values and, for sample farms, on the basls of data reported for expenditures for feed, poultry and livestock purchases, hired labor, etc.

Questions relating to poultry other than chickens (and broilers) were generally the same $\ln 1959$ as in 1954. In the 1959 census, however, only totai numbers were obtained for turkeys and turkey fryers ralsed and for turkey hens kept for breeding whereas the 1954 questionnaire asked for a breakdown between light and heavy breeds. Also, for poultry other than chickens and turkeys, the 1959 census obtained the number sold whereas the 1954 census obtained the number raised.

## Classification of Farms

Scope of Classification.-Data for land in farms, and for cropland harvested in farms classified by size, by color of operator and by tenure of operator were tabulated for all farms. However, most of the detailed data by size of farm, by color of operator, by tenure of operator, by economlc class, and by type of farm are estimates based on farms in the sample. The farm classifications by size of farm, color of operator, tenure of operator, economic class of farm, and type of farm were made in the processing office on the basis of data reported on each questionnaire.

Farms by Size.-Farms were classified by size according to the total land area establlshed for each farm. The same classification was used for all States. According to definition, a farm Is essentially an operating unit, not an ownershlp tract. All land operated by one person or partnership represents one farm. In the case of a landlord who has assigned land to cronpers or other tenants, the land assigned to each cropper or tenant is considered a separate farm even though the landlord may operate the entire landholding as one unit in respect to supervision, equipment, rotation practice, purchase of supplies, or sale of products. In some parts of the South, a special Landlord-Tenant Questionnaire was used to assure an accurate enumeration of each unit wlthin a multiple-unit operation. A change was made in the size classlficatlon for 1959, as contrasted with several preceding years, by subdlviding the 1,000 -acre-and-over group and by combining two previously recognized groups, viz., 10 to 29 acres and 30 to 49 acres.

Farms by Color of Operator.-Farms were classified by color of operator into two groups, "white" and "nonwhite." "Nonwhite" includes primarily Negro and Indian operators but aiso some of other racial origin.
Enumerators were instructed to report the race on the basis of their own observatlon whenever possible rather than by asking the respondent.

Farms hy Tenure of Operator.-The classification of farms by tenure of operator was based on data reported for land owned, land rented from others or worked for others on shnres, land managed for others, and land rented to others or worked on shares by others. The same basls of classification was used in 1959 as in 1954.

For 1959 , each questionnaire was coded, during the editing process, to indicate whether it represented a fnrm opernted by a full owner, part owner, manager, or tenant. The sample questionmaires for tenants were given a code to indicate the kind of tenant.

The various classificntions of tenure, as used for the 1959 census, are defined below:
a. Full Owners npernte only land they own.
b. Part Owners operate land they own and also land rented from others.
c. Managers opernte land for others nad are paid a wage or salary for their services. Persons acting mereiy as caretakers or lired as laborers are not clussified as managers. If n farm operator managed land for others and also operated land on his own account, the land operated on his own account was considered as one farm and the iand managed for others as a second farm. If, however, he managed land for two or more employers, all the managed iand was consldered to be one farim.
d. Tenants rent from others or work on shares for others all the land they operate. They are further classified, as described below, on the basis of rental arrangements in regard to the payment of cosh rent, sharing of crops, sharing of livestock or livestock products, and the furnlshing of work power by the landlord.
(1) Cash Tenants pay cash rent, elther on a per-acre basis or for the farm as a whole.
(2) Share-Cash Tenants pay part of the rent ln cash and part in a share of the crops and/or of the livestock and livestock products.
(3) Crop-Share Tenants pay a share of the crops but not of the livestock or livestock products.
(4) Livestock-Share Tenants pay a share of the livestock or livestock products. They may or may not also pay a share of the crops.
(5) Croppers are tenants whose landlords furnlshed all the work animals or tractor power. They usually work under the close supervlsion of the landowners or their agents, or other farm operators. Also, the land asslgned to them ls often merely a part of a multi-unit operation. Croppers may or may not also pay cash rent or a share of crops, llvestock, or livestock products. Data for croppers are avaliable for only 16 southern States and M1ssouri.
(6) Other Tenants are those who did not qualify for incluslon in any of the foregoing subclassifications. They may have had the use of land rent-free or in return for a fixed quantity of products, payment of taxes, maintenance of bulldings, etc.
(7) Unspecified Tenants are those for whom the rental arrangement was not reported.
The definition of each subclass of tenant was essentlally the same for earlier censuses as for 1959. In 1945, however, the enumerator was asked to determine the subclass of tenants whereas in other censuses all classifications were made during the processing of questionnaires on the basls of the data reported. The procedure used in 1945 may have affected the comparabillty of the data, especially for cash tenants and share-cash tenants.
Farms by Economic Class.-The totals for farms by economle class are estimates for all farms made on the basis of data reported only for the sample farms. The economle classlfications represent grouplngs of farms that are slmilar ln characteristics and size of operation. The economic classes were established on the basis of one or more of four factors: (1) total value of all farm products sold, (2) number of days the farm operator worked off the farm, (3) the age of the farm operator, and (4) the relationship of income received by the operator and members of hls household from nonfarm sources to the value of all farm products sold. Instltutional farms, Indian reservations, agriculturai experlment stations, and grazing associatlons were always classlfied as "abnormal."

The total value of farm products sold was obtained by addftion of the reported or estimated values for all products sold from the farm. The value of cattle and calves, horses and mules, dairy products, some poultry products, vegetables, nursers and greenhouse products, standing timber, and miscellaneous forest products was obtalned from the farm operator during the enumeration. The quantlty sold was obtained during enumeration for corn, sorghums, small grains, hay, small fruits, some of the forest products, chickens and chicken eggs, hogs, sheep, and goats. To obtain the value of sales of these products, the quantity sold was multiplied by State a verage prices.

For each of the other products, the entire production was multiplled by the State average price. If the resulting value amounted to $\$ 100$ or more, the entire quantity produced was considered as sold. This procedure was followed only in establishing the economic class and the type of farm but was not used in establlshing the total value of products sold from the farm. (See p. XXV.)

Farms were grouped into two major categories, commercial farms and other farms, mainly on the basis of total value of products sold. The 1959 class intervals and some of the criteria for determination of a given class are different from those used in 1954 and in 1950. In general, for 1959, all farms with a value of sales amounting to $\$ 2,500$ or more were classifled as commercial. Farms with a value of sales of $\$ 50$ to $\$ 2,499$ were classified as commercial If the farm operator was under 65 years of age and (1) he did not work off the farm 100 or more days during the year and (2) the income recelved by the operator and members of his family from nonfarm sources was less than the value of all farm products sold. The remaining farms with a value of sales of $\$ 50$ to $\$ 2,499$ and institutional farms and Indian reservations were included in one of the groups of "other farms."

Commerclal farms were divided into six economic classes on the basis of the total ralue of all farm products sold, as follows:

| Class of Farm | Value of Farm |  |  |
| :---: | :---: | :---: | :---: |
| I | \$40,000 | and | over |
| II | \$20,000 | to | \$39,999 |
| III | \$10,000 | to | \$19,999 |
| IV | \$5,000 | to | \$9,999 |
| V | \$2,500 | to | \$4,999 |
| VI* | \$50 | to | \$2,499 |

- Provided the farm operator was under 65 years of age, and-
(1) be did not work off the farm 100 or more days, and (2) the fucome that be and members of his household received from nonfarm sources was less than the total value of farm products sold.
Other farms were divided into three economic classes as foliows:
a. Class VII, Part-time.-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classified as "part-time" if the operator was under 65 years of age and he either worked off the farm 100 or more days or the income be and members of his household received from nonfarm sources was greater than the total value of farm products sold.
b. Class VIII, Part-retirement.--Farms with a value of sales of faim products of $\$ 50$ to $\$ 2,499$ were classified as "partretirement" If the farm operator was 65 years old or over. Many of these are farms on which the income from nonfarm sources was greater than the value of sales of agricultural products. Others are residential, subsistence, or marginal farms. In prevlous censuses, the age of the farm operator was not a criterion for grouping farms by economic class. Since the number of elderly people in our population bas been steadily increasing during recent years, a separate classification for farms operated on a part-retirement basis was considered important for an adequate analysis of the agricultural structure of a county or State.
c. Class IX, Abnormal.-All institutional farms and Indian reservations were classified as "abnormal," regardless of the value of sales. Institutional farms include those operated
by hospitals, penitentiaries, schools, grazing assoclations, government agencies, etc.
Farms by Type.-The data for farms by type are estimates bused on data tabulated for the farms in the sample. The type represents a description of the major source of income from farm sales. To be classifted as a particular type, a farm had to have sales of a partlcular product or group of products amounting in value to 50 percent or more of the total value of all farm products sold during the year.
The types of farms, together with the products on which type classification is based, are as follows:

| Type of Farm | Source of Cash Income |
| :---: | :---: |
|  | (Products with sales value representing $50 \%$ or more of total value of all farm products sold) |
| Cash-grain | Corn, sorghums, small grains, soybeans for beans, cowpeas for peas, dry field and seed beans and peas. |
| Tobacco | Tobacco. |
| C | Cotton. |
| Other field-crop | Peanuts, potatoes (Irlsh and sweet) sugarcane for sugar or sirup, sweet sorghums for sirup, broomeorn, popcorn, sugar beets, mint, hops, and sugar beet seed. |
| Vegetable | Vegetables. |
| Fruit-and-nut | Berries, other small fruits, tree fruits, grapes, and nuts. |
| Poultry | Chickens, chicken eggs, turkeys, and other poultry products. |
| Dairy | Milk and cream. The criterion of 50 percent of total sales was modifled in the case of dalry farms. A farm having salue of sales of dairy products amountling to less than 50 percent of the total value of farm products sold was classified as a dairy farm, lf- |
|  | (a) Milk and cream sold accounted for more than 30 percent of the total value of products sold and- |
|  | (b) Milk cows represented 50 percent or more of total cows and- |
|  | (c) The value of milk and cream sold plus the value of cattle and calves sold amounted to 50 percent or more of the total value of ali farm products sold. |
| Livestock other than |  |
|  | and mohair except for farms in the 17 Western States, Louisiana, and Florida that qualified as livestock rauches. |
| Livestock Ranches | Farms in the 17 Western States, Louisiana, and Florida were classifled as livestock ranches if the sales of livestock, wool, and mohalr represented 50 percent or more of the total value of farm products sold and if pastureland or grazing land amounted to 100 or more acres and was 10 or more times the acreage of cropland har vested. |
| Genera | Field seed crops, hay, silage. A farm was classiffed as general also if it had cash income from three or more sources and did not meet the criteria for any other type. |
| Miscelianeous | Nursery and greenhouse products, forest products, mules, horses, colts and ponies. Also all institutional farms and Indlan reservations. |

The type classifications were essentially the same for the 1959 as for the 1954 census except that tobacco farms and livestock ranches were not separately classified in 1954 . Tobacco was included as one of the crops used in the classification of "other field crop" farms in 1954. The farms classified as livestock ranches in 1959 would have been classified as "lirestock other than dairy and poultry" in 1954 without regard to the acreage in pasture.

Value of Farm Products Sold.-Data for the value of farm products sold in 1959 were obtained by enuneration for some products and by estimation for others. The questionnaire used for the 1959 census provided for farm operators to report value of sales for the following products:
Vegetables Miscellaneous poultry products
Nursery and greenhouse prod-
ucts Milk and cream Cattle
Stauding timber

## Catres

Miscellaneous forest products Horses, mules, colts, and ponies For all other agricultural products, the value of sales was estimated during the office processlng. The State average prices used for calculating the value of farm products sold were furnished to the Bureau by the Agricultural Marketing Service of the U.S. Department of Agriculture. One of three following procedures was used.
(1) For the products for which data on quantities sold were obtained during enumeration, the State average prices were multiplied by the county totals of the quantities reported as sold or the quantities reported as produced for sale. The following products were covered by this procedure:

| Corn for grain | Fence posts |
| :--- | :--- |
| Sorghums for grain, seed, sirup, | Sawlogs and veneer logs |
| or dry forage | Christmas trees |
| All small grains | Chickens (broilers and others) |
| Hay crops | Chicken eggs |
| All berries and small fruits ${ }^{\text {: }}$ | Hogs and pigs |
| Firewood and fuelwood | Sheep and lambs |
| Pulpwood | Goats and kids |

${ }^{1}$ Adjustment made for cranberries based on Cranberry Payment Program.
(2) For most of the agricultural products which are customarily raised for sale, the entire quantity produced was considered to be sold. The State average prices were, accordingly, multiplied by the county total of production. The following crops were covered by this procedure:

Cotton
Popcorn
Sugar beets for sugar
Broomeorn

Sugarcane for sugar

## Tobacco

Wool
Mohalr
(3) For all other crops, the State average prices were nuttiplied by the quantities sold as estimated on the basis of cropdisposition data furnished by the Agricultural Marketing Service, data reported in questions for "other crops" on the 1959 questionnaire, or data obtained from earlier censuses.

For all tree fruits, nuts, and grapes, the entire quantity produced was considered as sold, excelt for apples, apricots, sour and sweet cherries, peaches, plums, prunes, avocados, tangerines, oranges, and grapefruit in States where a portion of the crop was not harvested or was suljected to excess cullage as indicated by data obtained from the Agricultural Marketing Service of the U.S. Department of Agriculture.

The data for 1959 are comparable with those for 1954 since essentially the same procedures were used in both censuses for estimating quantities and vatues of farm products sold. In 1959, as in 1954, data for the sales of farm products represent total sales for the entire farm, regardless of who shared the receipts. For tenant-operated farms, the landiord's share of agricultural products was considered as sold provided the products were moved off the tenant farm. All crops, livestock, and poultry raised under a contract arrangement were considered as sold from the farm where they were raised. For institutional farms, all agricultural items produced on land operated by the institution and consumed by the inmates were to be reported as sold.

Alt sales data relate to one year's farm operations. Crop sales are for crops barvested during the crop year, whether the crops were actually sold immediately after harvest or placed in storage for later sale. Sales of livestock and livestock products relate to the calendar year, regardless of when the livestock or products were raised or produced. All wool and mohair reported as shorn or clipped was considered as sold.

Enumerators were instructed to record gross values of quantities sold, with no deductions for feed, seed, fertilizer, water, labor, or marketing costs. For some products, however, net values may have been reported. In the case of milk, particularly, some farm operators may have reported the payments they received as the gross value of sales, even though the buyer had deducted handling and hauling charges before making payment. Adjustments were made in the data reported only in cases of obvious error.

Chapter A

## STATISTICS FOR THE STATE

(1)
(Data on satue of land and buildince fur 1950. 1454, and 1050 are based on roports for only a sample of famsas. we wat

[^3]State Table 8.-FARMS REPORTING, ACREAGE, QUANTITY HARVESTED, AND SALES OF CROPS: ${ }^{2}$ (EENSUSES OF 1920 TO 1959-Continued

## NA Not avaliable.

2 Reported in strall frectians.

 harvested for grain.
${ }^{3}$ Value of corm and other corm products sold.
${ }^{4}$ corn cut for forage.
${ }^{5}$ Sorghums for all purposes, except for sirup.
${ }^{6}$ Includes reports for sugarcane for sirup.
Value of sorghms sold for hay or forage included in value of sorghum sold for graln or seed.
The 194 and 1939 figures do not fnclude acres plowed under for green manure. The 1944 figures are for acres grown alone
${ }^{9}$ For 1944 , soybeans and compeas harvested for hay. Prlor to 1944 , annual legumes saved for hay, but excluding vetches in 1924.
${ }^{10}$ For figures on annual legumes saved for hay, includtng cowpeas and peanut vines, see soybeans cut for hay.
${ }^{11}$ Calculated value of peanuts harvestad for nuts, peanuts harvested for hay, and peanuts hogged or grazed.
${ }^{2}$ Includes acres grown with other crops.
${ }^{13}$ Reported in busbels.
${ }^{14}$ For all Censuses except 1950, obtained by adding the indivdual hay crops.
${ }^{25}$ Includes ats cut for feeding unthreshed.
${ }^{6}$ Silage crops other than corn and sorghans.
${ }^{17}$ Clover seed, except sweetclover.
${ }^{18}$ Clover seed, including sweetclover
${ }^{19}$ Includes proso millet.
${ }^{20}$ Value of lint cotton only.
 See text.
${ }_{23}$ Includes receipts from sale of pasture and greaing privileges.
${ }^{\mathbf{2 3}}$ Excludes Irish potatoes and sweetpotetoes, except for 1920 Census which included potatoes for hame use only.
${ }^{24}$ Excludes IFsh and sweet potatoes.
${ }^{25}$ Green IIma beans included with snap beans.
${ }^{26}$ hot peppers included with sweet peppers.
${ }^{27}$ For Censuses prior to 1950, small fruits harvested for hame use or for sale.
${ }^{28}$ Loganberries and youngberries included with boysenberries.
${ }^{29}$ For 1959 and 1954, does not Include data for farms wth less than 20 trees and grapevines. See text.
$30^{\circ}$ Does not include acreage for fans reporting less than $1 / 2$ acre. See text.

## PREFACE

Volume I, Counties, is one of the five principal reports presenting the results of the 1959 Census of Agriculture. This volume, in 54 parts, presents the compilation of the information given by farm operators to census enumerators in 1959.

The 1959 Census of Agriculture was taken in conformity with the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code.

The collection of the data was carried out by census enumerators directed by supervisors appointed by the Director of the Bureau of the Census and working under the direction of Robert B. Voight, then Chief, Field Division. Paul R. Squires, then Special Assistant to the Director, was responsible for the recruitment of the field staff. The planning of the census and the compilation of the statistics were supervised by Ray Ifurley, Chief, Agriculture Division, Warder B. Jenkins, Assistant Chief, and Orvin L. Wilhite, Assistant Chief. They were assisted by M. Vincent Lindquist, Thomas Jabine, Robert S. McCauley, John C. Mackey, Robert Standley, IIiton E. Robison, Helen E. Teir, Carl R. Nyman, Kenneth R. Norell, Ghadys L. Eagle, Henry L. DeGraff, Charles H. Boehne, Joseph A. Correll, Margaret G. Wood, Evelyn K. Jett, Simon Yablon, Emma B. Gass, Charlotte J. Messinese, Bennie L. Sharp, Lsaac E. Lemon, James M. Lindsey, Samuel S. Murray, William F. Kauffman, Hector Vila, IIarry P. Owings, Charles A. Nicholls, Menry A. Tucker, Robert S. Boyle, Helen M. Dasenport, Albert W. Graybill, Lois G. Miller, Thomas D. Monroe, Gerald P. Owens, Bernard L. Ross, Marvin M. Thompson, Helen D. Turner, Kurt W. Luethy, Arnold L. Bollenbacher, George W. Coffman, Joseph A. Horak, Samuel J. Hundley, Donald K. Larson, Chester G. Lykins, Wilmer R. Maxham, Virgil L. McClain, Jr., Darrell D. Prochaska, Robert I. Rades, Hubert E. Sites, Duane E. Traylor, Donald H. von Steen, Elmer O. Rea, Frances G. Compton, Lillian W. Bentel, and Neil V. Perkins.

Acknowledgment is made of the technical assistance and the loan of personnel by the United States Department of Agriculture in the planning, the cnumeration, and the compilation of the 1959 Census of $A$ griculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1959 FINAL REPORTS

Volume I-Counties-A separate part for each State. Statistics on number of farms; farm characteristics; acreage in farms; cropland and other uses of land; land-use practices; irrigation; farm faeilities and equipment; farm labor; farm expenditures; use of commercial fertilizer; number and kind of livestock; acres and production of erops; value of farm products; characteristies of eommercial farms, farms classified by tenure, by size, type, and economic elass; and comparative data from the 1954 Census of Agriculture.

Volume I is published in 54 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | New England States: | 19 | West North Central-Continued South Dakota. | 38 | Mountain: Montana. |

Volume II-General Report.-Statistics by Subjects, United States Census of Agriculture, 1959. Summary data and analyses of the data by States, for geographic divisions, and for the United States, by subjects, as illustrated by the chapter titles listed below:

| Chapter |  | Title | Chapter |
| ---: | :--- | :--- | :--- |

Volume III-Irrigation of Agricultural Lands. Western States (Dry Areas) - Data by States for drainage basins and a summary for the area, including number and types of irrigation organizations, source of water, expenditures for works and equipment since 1950, water used and acres served for irrigation purposes.

Volume IV-Drainage of Agricultural Lands. Data by States on land in drainage organizations, number and types of organizations, cost of drainage and drainage works.

Volume V-Special Reports, Part 1.-Horticultural Specialties. Statistics by ${ }^{*}$ States and a summary for the United States presenting number and kinds of operations; gross receipts and/or gross sales; sales of nursery products, flower seed, vegetables grown under glass, and propagated mushrooms; number of containergrown plants; inventory products; sales of bulb crops; employment; struetures and equipment.
Titles of additional parts of this volume are not available as this report goes to press.

## INTRODUCTION

## THE 1959 CENSUS OF AGRICULTURE

History of the Census.-The 1959 Census is the 17th nationwide agricultural census. The first agricultural census was taken in 1840, at the same time as the Sixth Decennial Census of Population. From 1850 to 1920 , an agricultural census was taken every 10 years. With increased application of scientific findings and the growing use of mechanization in agriculture, farming practices were changing so rapidly that facts collected at 10 -year intervals were no longer adequate. Aware of the need for more accurate and timely information, the Congress in 1909 (36 stat. 10 , sec. 31 , provided for a census to be taken in 1915 and every 10 years thereafter which was to be in addition to the census of agriculture to be taken at the time of the decennial census of population. The 1915 ceusus was not taken, however, because of the abnormal conditions created by World War I. Beginning with 1920, a national agricultural census bas been taken every 5 years.

Legal Basis for the Censns.-The 1959 Census of Agriculture was authorized by an Act of Congress, as were all prior censuses of agriculture. "Title 13, United States Code-Census," codifled in August 1954, and amended in August 1957 and September 1960, is now the legal basis for censuses of agriculture and other censuses, and surveys conducted by the Bureau of the Census. Section 142, paragraph (a), of Title 13 makes provision for the Census of Agriculture. It reads as follows :

#### Abstract

"The Secretary shall, beginning in the month of October 1959, and in the same month of every fifth year thereafter, take a census of agriculture, provided that the censuses directed to be taken in October 1959 and each tenth year thereafter, may, when and where dcemed advisable by the Secretary, be taken instead in conjunction with the censuses provided in section 141 of this title." (Section 141 relates to the decennial censuses of population, unemployment, and housing to be taken as of the first day of April of each decennial year.) Under authority granted by Section 4 of Title 13 , the Secretary of Commerce delegated "the functions and duties imposed upon him by this title" to the Director of the Bureau of the Census.

Pretest of the 1959 Census.-A "pretest" of the field procedures of the 1959 Census of Agriculture was conducted in 17 counties of the United States during the fall of 1958 . The purpose of the pretest was to provide the Bureau with a measure of the effectiveness of the questions and procedures planned for the 1959 nationwide census. Three versions of the agriculture question-naire-the first one for Northern States, the second for Southern States, and the third for Western States-were used in the pretest. Each version contained questions appropriate to the type of agriculture in the part of the country where it was used. All major aspects of field forms and procedures, from the hiring and training of crew leaders and enumerators to actual interviews with farm operators, were given a "trial run" in each of the $\mathbf{1 7}$ counties. Preliminary versions of reporting forms, maps, payroll records, training guides, and instruction manuals were subjected to actual use under conditions simulating those expected in the nationwide enumeration conducted in the fall of 1959.

In making final preparations for the 1959 census, the staff of the Bureau drew heavily on the results of the pretest, as well as on experience gained from previous censuses.

Training Program for Personnel for Enumeration.-Every person hired to do work in connection with the 1959 Census of Agriculture received specialized training for his job. Staff mem-
bers of the Washington and Reglonal Offices of the Bureau and of the U.S. Department of Agriculture trained approximately 110 agriculture field assistants and 2,100 crew leaders. The crew leaders, in turn, trained and supervised approximately 30,000 enumerators. All training was presented according to procedures contained in various guides and manuals prepared by the Bureau. The training program included filmstrips, map-reading, practlce interviewing, and practice filling of questlonnares and other census forms. In most instances, tralning sessions were held near the areas in which employees worked and lmmediately prior to the beginning of their assignments.

Enumeratlon Perlod.-The actual enumeration in the conterminous United States (see page XIV) started at dates varying from October 7 to Norember 18, 1959. In general, starting dates were based upon regional variations $\ln$ harresting seasons and on weather conditions. The primary aim was to have the enumeration late enough to follow the harvesting of the bulk of important crops and early enough to precede the adrent of winter weather with the attending unfavorable travel conditions. The bulk of the enumeration work was completed within three to four weeks after the starting date. In Hawail, the enumeration was made during the months of December 1959 and January 1960 ; and in Alaska, during April 1960.

Enumeration starting dates for the censuses of 1959 and 1954 are given in State table 11, together with figures showing the percentage of farms enumerated in the State during weekly periods. The average enumeration date for the 1959 census for each county is given in county table 6.

Data for inventory ltems-land in farms, machinery and equipment, livestock, and poultry-relate to the situation at the actual time of enumeration of each individual farm. Data for acres, production, and sales of crops relate generally to the crops harrested during the crop jear 1959 , regardless of whether and when they were sold while data for sales of livestock and livestock products relate to the calendar year 1959. Since the enumeration was made before the end of 1959 , special emphasis was placed upon the inclusion of estimates for crops yet to be sold and for livestock and livestock products expected to be sold $\ln$ the period from the time of enumeration to the end of the calendar year. Instructions on the questionnaire and the wording of questions were designed to assure that full crop-jear or calendar-year data would be reported. For example, "How much of this jear's crop was or will be sold?"

## ENUMERATION FORMS AND PROCEDURES

Authorization.-Section 5 of Title 13 of the United States Code authorizes the preparation of forms and questlonnaires used in the census. It reads as follows:
"The Secretary shall prepare schedules, and shall determine the inquiries, and the number, form, and subdivlsions thereof, for the statistics, surveys, and censuses provided for in this title."
The Agriculture Questionnalre.-The questionnalre for the 1959 Census of Agriculture was prepared by the staff of the Bureau. Selection of the inquirles was based on the results of the 1958 pretest and experlence gained in earlier censuses. Careful consideration was given to such factors as the current availability
of data from other sourees, the possibility of obtaining data by methods other than a census, the adequacy of the data that might be obtained, and the need for and usefulness of the data. Two committees gave advice and counsel to the Bureau. One of these, a Special Advisory Committee, was composed of members designated by the organizations they represented, following an invitation from the Director of the Burean of the Census to name a representative to serve in an advisory capacity. The Special Advisory Commitlee for the 1959 Census of Agriculture was made up of one representative from each of the following: Agricultural Publishers Association, American Association of LandGrant Colleges and State Universities, American Farm Bureau Federation, American Farm Economic Association, American Statistical Association, Farm Equipment Institute, National Association of Commissioners, Secretaries, and Directors of Agriculture, National Council of Farmer Cooperatives, National Farmers' Union, National Grange, Rural Sociological Society, and the U.S. Department of Agriculture. A representative of the Bureau of the Budget was in attendance at all meetings of the Advisory Committee.
Because of the special interest of the U.S. Department of Agriculture in censuses of agriculture, the Director of the Bnreau of the Census sought the continuous cooperation of that organization in developing plans, questionnaires, and procedures for the 1959 Census of Agriculture. Working Groups were established in the U.S. Department of Agriculture to make recommendations for the following general subjects:

$$
\begin{aligned}
& \text { Tenure, Land Values, and Mortgage Debt } \\
& \text { Land Use and Conservation and Production Practices } \\
& \text { Field Crops } \\
& \text { Fruits and Vegetables } \\
& \text { Forest Products } \\
& \text { Livestock, Poultry, and Dairy } \\
& \text { Income and Expenditure (including Contractual Operations) } \\
& \text { Farm Labor } \\
& \text { Equipment and Facilities (including Structures) }
\end{aligned}
$$

Each Working Group had the responsibility for ascertaining the U.S. Department of Agriculture's need for data in the field covered by its "terms of reference" and for presenting recommendations to a small Joint Committee comprising representatives of both the Bureau of the Census and the U.S. Department of Agriculture. The Joint Committee received written recommendations from each Working Group. The Chairman of each Group appeared before the Joint Committee as did any member of the Working Group who was needed to present supplemental information of a specialized nature.
Prior to the formulation of the questionnaire, State Agricultural Colleges and other major users of census data were invited to suggest inquiries for the enumeration. Each member of the Special Advisory Committee had the opportunity and the responsibility for channeling in suggestions from the organization he represented. The number of inquiries submitted from all sources greatly exceeded the number that could be included in the census, from the point of view of cost, of the respondent's Ilme and patience, and of practical value to the majority of users of data.

The final selection included 316 questions, some of which consisted of several parts, for the 48 States comprising the conterminous United States. Although each of the 316 questions was asked in one or more of the 48 States, considerably less than this total was asked in any one State because of the use of "State" questionnaires. Moreover, about 50 questions out of the total were asked of approximately one-fifth of all farm operators in the State. The number of questions ranged from 159 on the questionnaire for Maine to 194 on the questionnaire for California. In all, 38 versions of the questionnaire-one for each State or combination of adjoining States and two for Texas-
were used for the 1059 census in the conterminous United States as compared wilh 21 versions in 1954 and 41 in 1950 . A separate version was used in Alaska and another in Hawaii.

Differences in the questlonnaires were designed to aceount for regional and local differences in agriculture. Most, but not all, of the differences related to crops. The use of State questionnaires made possible the inclusion of separate inquiries for all important crops grown within a State and, at the same time, a reduction in the total number of inquiries for a State. Questions that did not apply, to any considerable degree, to a particular State were omilted from the questionnaire used in that State. For example, separate questions about citrus fruits were omitted from all questionnaires except for the few States where citrus fruits are grown. An added advantage of State questionnaires was that production and sales data could be asked in the unit of measure most commonly used by the farmers in each State. Regional variation in the number and type of questions is an important provlsion of the census for obtaining com. plete coverage of agricultural operallons.

About 2 weeks before the start of the enumeration, agrleulture questionnaires were mailed to most households in rural areas. A letter was atiached to each questionnaire asking the farm operator to fill the questionnaire and to give it to the enumerator when he called. The purpose of this procedure was to save time and money in taking the census and to improve the quality of the information given by farm operators. By having the questionnaire ahead of time, the farmer could determine what information would be required and could eheck his records in advance of the enumerator's visit. It was, however, the responsibility of the enumerator to obtain an agrieulture questionnaire for each place which qualified. If the questionnaire had been filled out by the farm operator, the enumerator was instrueted to examine the questionnaire for completeness and aecuracy and, if need be, to give the farmer such help as might be necessary.

Agricultural 0perations.-The training of enumerators stressed the concept that a census of agricullure is a census of agricultural operations rather than a census of farms. This concept was intended to assure a complete agricultural census free of any personal judgment by enumerators as to what constitutes a farm. In accordance with clearly defined procedures, an enumerator was required to obtain an agriculture questionnaire for each person who had charge of one or more agricultural operations, whether or not he considered himself to be a farm operator. For enumeralion purposes, it was considered that there were agricultural operations on a place if, at any time in 1959-
a. Any livestock (hogs, eattle, sheep, goats, horses, or mules) were kept on the place.
b. A combined total of 20 or more chlekens, turkeys, and ducks were kept on the place.
e. Any grain, hay, tobaceo, or other field crops were grown on the place.
d. A combined total of 20 or more frult trees, grapevines, and nut trees were on the place.
e. Any vegetables, herries, or nursery or greenhouse produets were grown on the place for sale.
As a result of the requirement that all places having agricultural operations be enumerated, more questionnaires were obtained than are included in the tabulations for farms. During the office processing operations that followed the completion of ennmeration, criteria were applied to the questiommaires to sort out for tabulation those that represented farms according to the census definition of a farm (see page XIV).

Enumeratlon Assignments and Enumeration Districts.-To assure a complete enumeration wlthln the tlme allot ted, the United States (excluding Alaska and Hawail) was divided into 29,374 Enumeration Assignments, or EA's. Each EA comprised an
area that one enumerator could rensonably be expected to canvass within $n 3$ - to $f$-week period, as indicated by performance records from the 1904 census.

Each EA was made up of one or more Enumeration Districts, or "ED's," as the geographic unit for enumeration. Prior to the enumeration, the ED's were classified into three groups on the basis of the density of drellings in relation to the number of farms, as indicated by the 1954 Census of Agriculture, the 1950 Census of I'opulation and Housing, current population estimates, and highway maps showing culture which were basic to establishing the boundaries of each asslgnment. Through the use of different canrassing procedures for each group of ED's, the Bureau was able to reduce the cost of enumeration without running any material risk of missing any farms or other places with agricultural operations. The ED groupings and canvassing procedures are deseribed below.

Group I Enumeration Districts.-In general, ED's with no well-defined cluster of dwellings were considered to be opencountry areas and comprise Group I. For each ED of Group I, in his Enumeration Assignment, the enumerator was required to list in his Record Book the name of every head of household living in the ED and also the name of every person not living in the ED who had agricultural operations there. There were approximately 20,75I ED's in Group I for the 1959 Census.

Group II Enumeration Districts.-Rural ED's in which the number of dwellings was large in relation to the number of farms were considered to be in Group II. For each ED, In Group II, the enumerator was required to list the head of the household for all dwellings in the ED except for those on less than one acre of ground in built-up residential areas of 50 or more dweilings. He was also required to determine, by observation or local inquiry, whether there were any farms or other places with agricultural operations in the built-up areas and, if so, to obtain an agriculture questionnaire. There were approximately $7,979 \mathrm{ED}$ 's in Group II.

Group III Enumeration Dlstricts.-Most incorporated places and unincorporated villages having approximately 150 or more dwellings were designated as separate ED's and are classified as Group III. Also, most ED's in counties around large metropolitan areas were designated as Group III Ed's. Prlor to the 1959 Census of Agriculture, places enumerated in these areas during the 1954 Census of Agriculture were listed In the Enumerator's Record Book. The enumerator was required to visit and enumerate or otherwise account for each place listed in his Record Book. In addition, he was instructed to ask at each of these places if there were any farms or other places with agricultural operations in the Enumeration District, and, if so, to add them to his list and enumerate them. There were approximately 15,836 Group III ED's in 1959 . According to the 1954 Census, these ED's contained 380,575 farms.
A few enumeration districts that comprised incorporated places or that were within an incorporated city were classified as Group 1 or Group II because they had a large number of farms. A few others, comprising extensive rural districts requiring considerable travel, were classified as Group III because they had only a small number of farms.

Enumerator's Record Book.-Each enumerator received one or more Record Books containing a listing form for use during canrassing. (See appendix for facsimile of one page of listing form included in Enumerator's Record Book.) The lines on the listing form were numbered in consecutive order. Except as otherwise prescribed for Group II and Group III ED's, the enumerator listed in his Record Book the name of each head of household living in his assigned area and also the name of each person not living in his area who had agricultural operations there. As he made bis listing, he also asked the questions about agricultural operations that were printed on the listing form. Answers to these questions determined, for the enumerator, whether or not an agriculture questionnaire was required for the person listed and, if so, whether he or some other enumerator was responsible for getting it. Thus, the Record Book served as an important aid to the enumerator $\ln$ securing complete coverage of all agricultural operations within his area. At the same
time, lt helped to prevent enumeration of the same place by two or more enumerators.

Enumeration Maps.-As a second ald to getting complete coverage, each enumerator recelved a map or, in a few exceptional cases, a brief written description of the area assigned to him for enumeration. He was required to plan and follow an orderly route of enumeration within the boundaries of his assigned area in accordance with established canvassing procedures. As the enumerator listed a place in his Record Book, he indicated its location by copying onto hls map the number of the llne on which he listed it. This numbering system indicated the enumerator's route of travel, and helped both the enumerator and hls crew leader to determine the extent of coverage of the enumerator's assignment at any given time.

Lists of Special and Large Farms.-Prior to the enumeration, a card list of "special and large farms" was prepared on the basis of records obtained from the 1954 census and from Federal and State agricultural agencies. In general, "special and large farms" fell into one of three categories: (1) farms having unusually large acreages, livestock lnventorles, or annual sales as indicated by available records; (2) farms known to be specializing In such operations as broiler productlon, turkey growing, feed lots, nursery or greenhouse production, cranberry bogs, citrus groves, etc.; (3) farms that might easily be overlooked because they had absentee operators or were not locally thought of as farms, such as institutions, Indlan reservations, grazlng associations, etc.

Enumerators were given the cards for the special and large farme within their assignment areas to use as aids to obtaining complete coverage. Generally, the cards provided lnsurance against the omisslon of farming units that could have a slgnificant effect on the totals for a given county or State. The enumerator was instructed to obtaln an agriculture questionnaire for each special or large farm in his area or to write an explanation on the card as to why an agriculture questlonnaire was not required on the basis of 1959 operations. The crew leader had a duplicate set of cards for use in checking enumeration coverage,
Landlord-Tenant Questionnare.-As in several previous censuses, a special landlord-tenant questlonnaire was used in some parts of the South as a supplement to the agriculture questionnaire. Its purpose was to help the enumerator get complete and accurate coverage of individually operated tracts of land that were actually part of one operating unit under the control of one landlord. To accomplish this purpose, the enumerator was required to fill a landlord-tenant questionnaire for each landlord who had any land worked on shares. The entries made in this questionnaire included the name of each sharecropper, tenant, or renter ; the amount of land assigned to each; and the acreage and quantity of crops harvested on shares. By checking these entries against the agriculture questionnaires obtained for the individual operators, the enumerator and the Central Office could verify that each part of the operating unit controlled by the landlord was enumerated and that it was enumerated only once. The landiordtenant questionnaire was used in 386 counties in the 1959 census as compared with approximately 900 counties $\ln 1954$.

Townshlp sketch Map.-In some areas of the Great Plains, a considerable portlon of land is farmed by nonresident operatorsthat is, by persons who do not live on the land they operate or who live on it only during part of the year. Enumerators in these areas used a spectal mapping form, the Township Sketch, in addition to their enumeration maps as an ald to obtaining complete coverage. Each township included on the sketch was identified by township and range number and was divided into 144 small squares. In a standard section of 640 acres, each square represented a quarter section of land, or 160 acres. As the enumerator canvassed his nssignment area, he indicated the acreage and location of each farm, ranch, and tract of nonfarm
land by drawing its boundaries on the sketch. He also used a simple numbering system as a cross reference between the agricultural land identified on the sketch and the questionnaire on which it was reported. The Township Sketch was used in all counties of North Dakota and South Drkota and in selected counties of Colorado, Kansas, Minnesota, Montana, Nebraska, New Mexico, Oklahoma, and Wyoming.

Field Review of Enumerator's Work.-In the 1959 census, greater emphasis was placed on a detailed review of enumerators' work during enumeration than had been the case in previous censuses. The objective was to detect and correct enumeration errors as early as possible in order to achieve and maintain a high quality of individual performance. Starting on the first day of enumeration and continuing througliout the enumeration period, each crew leader was instructed to make reguiar and frequent visits to his enumerators. At each visit, he was to follow a clearly defined procedure for observing the enumerator's conduct of interviews and for checking his iistings, maps, questionnaires, and other forms for accuracy and completeness.

As an aid to checking coverage and enumerator efficiency, the crew leader was given a list containing estimates, based on the 1954 census, of the number of questionnaires required in each enumeration assignment area within bis district, and of the mileage and time required to obtain those questionnaires.

## SAMPLING

Use of Sampling.-In the 1959 census, as in several previous censuses, sampling was used in two ways: for enumeration and for tabulation. Sampling in enumeration consisted of the collection of information about the items included in sections $I X$ through XV of the questionnaire for only a sample of farms. The "sample" items relate to sales of dairy prodncts and saies of livestock, use of fertilizer and lime, farm expenditures, land-use practices, farm labor, equipment and facilities, rentai agreements, farm values, and farm mortgage debt. The same sample of farms was used for tabulations by type of farm and by economic class of farm and for many of those by size of farm and by color and tenure of operator.

Description of the Sample.-The sample used for the 1959 Census of Agricuiture consisted of all farms with a total area of 1,000 or more acres or with estimated sales of $\$ 100,000$ or more in 1959 , and approvimately 20 percent of all other farms. Farms with 1,000 or more acres were universally included in the sample during enumeration. As the enumerator filied the questionnaire, he determined the number of "acres in this place" (see question 7 of the agricuiture questionnaire). If the acreage amounted to 1,000 or more be was required to fill sections IX through XV of the questionnaire. Farms with less than 1,000 acres, with estimated sales of $\$ 100,000$ or more, were included ln the sampie during the office processlag. For these farms the information for sections IX through XV was obtained by maii.

The selection of farms of less than 1,000 acres for inciusion $\ln$ the sample was made during enumeration, according to the following procedure: As the enumerator determined that he was required to obtain a questionnaire, he assigned a number to it, whether or not he was able to obtain the questionnaire on bis first visit. He assigned numbers in consecutive order, beginning with " 1 " for the first questionnaire required in each enumeration district within his area. He was instructed to fill sections IX through $X V$ on ali questionnaires for which the assigned number ended in " 2 " or " 7 ", (i.e. $2,7,12,17,22$, etc.).

Adjustment of the Sample.-An adjustment in the part of the sample that was comprised of farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$ was made by a process essentially equivaicnt to stratifying the farms ln the sampie by
size of farm. The purpose of thls adjustment was to lmprove the reliability of the estimates based on the sample and to reduce the effects of possibie biases introduced by enumerators who deviated from the prescribed procedure for selecting the sample farms. The adjustment procedure was carried out for "blocks" of counties, each consisting of from one to ten countles In a State. To adjust the sampie, separate counts were made for each county, and for the biock of counties of ail farms and of farms in the sample for each of 10 size-of-farm groups based on the "acres in this piace" (question 7). The 10 slze-of-farm groups were as follows: under 10 acres, 10 to 49 acres, 50 to 69 acres, 70 to 99 acres, 100 to 139 acres, 140 to 179 acres, 180 to 219 acres, 220 to 259 acres, 260 to 499 acres, and 500 to 999 acres. Farms of less than 1,000 acres, but with value of sales of $\$ 100,000$ or more, were excluded from these counts. For each size-of-farm group. the number of farms in the sample for the block of counties was adjusted to make it equal or approximateiy equal to the total number of farms divided by five. Thls was accompllshed for each group by the elimination or dupication on a random basls, of farms in those counties where the difference between the actual proportlon in the sample and the expected 20 percent was in the same direction as the difference for the biock of countles.

Estimation of Totais for the Sampie.-For the ltems Included in the sample part of the questionnaire (sections $I X$ through $X V$ ), estimated totals for all farms were derived from the tabulated totais for the farms in the adjusted sampie. First, item-byitem totais, as tabuiated for that part of the sample comprising farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$, were multipied by 5 . These estlmated ltem-byitem totals were then added to the corresponding Item totals, as tabulated, for all farms of 1,000 acres and over and farms with estimated sales of $\$ 100,000$ and over. The resulting values represent the estimated totals for ali farms.

Presentation of Sample Data.-In tables where a small amount of data based on the sample farms is presented together with data for all farms, the data based on the sample are printed in italics. Other tables contain headnotes explaining that most of the data are estimates based on reports for only a sample of farms.

Reliablity of Estimates.-The estimated totals for all farms of the items enumerated for only the sample farms are subject to samplling errors. The estimated totals obtained by maklng tabulations for only the farms included in the sample are also subject to sampling errors. State tables 23 and 24 contain approximate measures of the sampling reiiablity of the eatlmates for numbers of farms reporting and for item totals. Whlle these measures indicate the general levei of sampling reliablilty of the estlmates, they do not completely reflect errors arlsing from sources other than sampling ; for example, errors in the orlglnal data reported by farmers. Errors arising from sources other than sampling may, in some instances, be relatlvely more lmportant than aampiling variation, especially for county totals.

The generai ievel of sampling reliability of estimated totala may be determined from the data in State tables 23 and 24. State table 24 contains a llst of ltems, together with a flgure for each ltem lndicating one of the four leveis of sampling reliabllity that are presented in State table 23 . For each lem the sampling error according to the number of farms reporting may be determined from State tabie 23, in the coiumn for the level of sampiing reliability designated in State table 24. To determine the sampling reliability for any item, reference must be made to State table 24 to find out which of the four levels of sampling reliablity given in State tabie 23 shouid be used, and also the approprlate county or State table to obtain the number of farms reporting the item.

As explained in State table 23, the level of sampling reliability designated as level I should always be used to determine the sampling reliability of estimated numbers of farms or uf farms reporting.

State table 23 shows percentage limits such that chances are about 68 out of 100 that the difference between an estimate based on the sample and the figure that would have been obtained from a tabulation of all farms would be no more than the percentage specified for the estimated number of farms reporting that item. The chances are abont 99 out of 100 that the difference would be less than $21 / 2$ times the percentage specified.

As indicated by the percentages in State table 23 , the smaller the number of farms reporting a given item, the larger the relative sampling error in the estimated total for that item. Even so, considerable detail is presented for each item, by several classitications of farms, in order to permit the appraisal of estimates for various combinations of items not shown in this report. Percentages and averages that mas be terived from the tables will generally have greater relative reliability than the corresponding estimated totals. However, significant patterns of relationships way be observed in the estimated totals even though the indiFidual data are subject to relatively large sampling errors.

The data representing estimates based on a sample of farms for the $\mathbf{1 9 5 4} 4$ census were obtained in essentialls the same way as in 1959. Therefore, State tables 23 and 24 may also be used to determine the sampling errors for the 1054 data.

Differences in Data Resulting From Differences in Tabulating Procedures. Many of the fignes in the tetailed State talles represent estimates obtained by tabulating only the sample farms. The totals for these detailed distributions will generally differ somewhat from totals presented in other tables obtained from different distributions which were tabulated on a 100 percent basis. Moreover, although most of the figures presented by counties were obtained from tabulations of all farms, the data in county table 4 for commercial farms, and all of the data in the counts tables on dairy products and livestock sold, fertilizer and lime, farm expenditures, land-use practices, farm labor, facilities and equipment, and value of land and buildings were estimated for each county on the basis of data tabulated for the farms in the sample. The State totals in the count $\boldsymbol{y}$ talles for these items, though based also on the sample, were ohtained in a different series of tabulating runs, and so mar differ slightly from totals presented in some State tables. For reasons of economs the sample distributions were not adjusted to the 100 percent totals even when such totals were available, nor were slight discrepancies resulting from different runs of the sample data always reconciled unless the differences were large enough to affect the usefulness or reliability of the data.

## PROCESSING OPERATIONS

Completion of Enumeration.-As an ennmerator completed bis assignment, he turned the portfolio containing questionnaires and other census materials over to bis crew leader. After making a final review of the enumerator's work, the crew leader mailed the portfolio to the Agriculture Processing Office at Parsons, Kansas. There, each enumerator portfolio was thoronghy checked for completeness of all required forms and for eorrect application of the sampling procedure.

Editing of Questionnaires.-Each agriculture questionnaire was ladiridually edited and coded before the information was transferred to punch cards and tabulated. As the first major step in the editing process, questionnaires that did not represent farms according to the census definition were withdrawn from fur-
ther processing. (See p. NIV.) As the seromblanjur step the remaining questiomaires were examined for errors, omissions, and inconsistencies. Among the specific items subjected to consistency chocks were the following:
a. Total acreage compared with its distribution by use.
b. Acreage of individual erops harvested compared with total cropland harvested.
c. Irrigated acreage compared with total acres in the farm.
d. Total acreage of individual crops for all purposes compared with the atreage harvested for specific furposes.
e. Quantity of crops harvested in relation to acreage harvested.
f. Sales in relation to production and, for livestork, to inventories.
g. Total livestock compared with the inventory by age and sex.
h. Rxpenditures compared with problatiom and insentories.

Obvious errers in calculations or in units of neasure, and misplaced entries were corrected as they were fomm. Entries not clearly legible were rewritten. Jany omissions or inconsistencies were disregarded during editing. Those of significant magnitule conld be and were handed more efficients and economitally during mechanial provessing uperations. Question. naires containing major inconsistencies and omissions were referred to members of the techmical staff for revietw. Depending on the magnitude of the data involved, the technical staff corrected (or supervisel the corroction of ) the questiomaires either on the basis of information reported for other farms of similar trpe in the area or on the basis of additional information received in response to letters directed to the farm operators.
Coding of Questionnaires.-Most of the numerical information on a questionnaire was selforoling in that the inquirs number was ntilized for the item identification on pund cards or on tabulations runs. However, sma manual coling was also necessary for such items as irrigated crops for selected states, crops infrequentls reported, miscellaneous poultry, etc: Code numbers were entered on questimnaires to elassify farms and, in shme cases, to identify data for individual items. All farms were codet by size of farm in terms of total aderage, by race, and by tenure of opmator. Farms in the 17 Western States, Lomisiana, and Hawaii were also coled on the basis of irrigatell cropland and irrigated pasture. Additional todes were apmied to all farms included in the sample to classify them by type of farm and by total value of agricultural products sold. Individual items were coded only where reports were reeeived for crops or pultry not covered by separate inquiries on the questionnaire. This coding was necessary to assure inclusion of the data in the appropriate farm produet totals.
Tabulation of Data.-After the questionnaires were edited and coded, the information on them was punched on cards. The cards were then mechanicalls sorted and fed into machines which transferred the data to tabulation sheets. One of the initial and primary steps in the machine handling of the punch cards was to separate and list those cards which lacked necessary information, those which contained inconsistent or impossible data, and those on which the data were possible but of such magnitude that a further review of the indivilual questionnaires was warranted. The listing shects were examined and, as necessars, the cards were corrected. When the cards for a partieular eumety were considered satisfactory, the data were tabulated.
Subject-matter specialists of the Bureau and the U.S. Department of Agriculture examined all tabulations for reasonablemess and consistency. As neeessary, thes made currections on the basis of a further review and reapraisal of the original reports and verifieation of the editing, coding, and punching.

## PRESENTATION OF STATISTICS

Statistical Content of This Report.-This report is part of Volume I of the 14.59 Census of Agriculture. Volume I consists of 54 parts, each part containing information about agriculture for a single State, Cummonwealth, or Possession. Each part contains county data for that particnlar state or area. The term "counts," as used in this report embraces election distriets in Alaska, parishes in Louisiana, municipios (municipalities) in Pnerto Rico, etc. The statistics for 1959 were obtained from the Census of Agriculture taken in the "conterminous United States" (see following paragraph), Hawaii, and Plerto Ricn during the period Oetober 1959 to Januars 1930 and in Alaska, Ameritan Samoa, Guam, and Virgin Islands as of April 1, 1960. Comparative data for sears prior to 1959 were obtained from earlier censuses.

In the planning of the mblications for the 1960 Censuses of Population and Housing and the $1!59$ Census of Agriculture, the term "conterminous United States," recommended by the Board of Geographic Names to designate the 48 -State area as it existed before Alaska and Hawaii lieeame States, was adofted by the Bureau of the C'ensus.

The definitions and explanations in this introduction for volume I qenerally hare application broad enough to include the States of Alaska and Itawai, and the Commonwealth of Puerto Ricn and the island possessions. However, sperific application in many instances mas be limited to the conterminous United States: for example references to earlier censusas, to the sampling arethods and procelures, to speeitic seetioms or questions on the questionnaires, and to specifie table numbers.

For each part of volume I (one part for each State or area), a facsimile of the appropriate questionnaire is reproduced in the appendix.

The statistics for States and counties are presented according to the same general plan as was followed in the volume I reports for the 1954 and the 1950 eensuses. State and county totals are given for nearly all items for which information was ohtained in the loat census. Howerer, most of the data by eeonomic class of farm, tspe of farm, and color and tenure of farm operator are giren only for States.

Comparative data for the States are given for each census year beginning with 1920. Comparative data for counties are given for the rears 1059 and 1054. For some items. the data obtained from the 1909 census are the only enes available. For comparative purposes 1090 data are carried in counts table 6 for the kind of road on which farms were located.

Comparability of Data.-The data ohtained frem the various censuses of agriculture are not strietly comparable for all items. For example, differentes from one census to another in the time of enumeration, the wording of the questions, and the detinition of a farm cause some lack of comparability. Differences considered to have a signifirant effeet on the comparability of data are described in the text and/or mentioned in footnotes to the tables.

Minor Civil Divisions.-As in prior censuses, data for most of the items included in the 1959 Census of Agriculture were tabnlated for minor civil divisions. The term "minor eivil division" applies to the primary subdivision of a counts into smaller geographie areas such as townships, precincts, districts, wards, beats, municipalities, etc. Figures for these smaller geographic areas are not included in any of the published reports, but they may be supplied upon reduest and pasment of the costs of comfiling and chereking the data.

Prior to the 1054 Census, an enumeration assignment dia net inelule more than one minor civil division, eren in cases where the township, precinet, ete, dill not have enough farms to provide a full workload for an enumerater. In 1954, and again $\ln 1959$,
the aim was to make enumeration assignments large enough to keep each enumerator fully occupied in his area for a 3-to 4-week period. Hence, in some areas, two or more adjuining minor civil divisions were combined into one enumeration assimment. An enumeration assignment never comprised the whole of one minor civil division and a part of another, nor a part w two er more minor civil divisions. A minor civil division that included too many farms far one ammeratur to cover during the enumeration period was divided into two or more emmeration assignments.

In some cases, the minor civil division tabulations provide totals for a single minor eivil division, even when such totals required a grompins of emmeration assiomments. In other cases, the minor civil division tabulations provide totals for a combination of two or more adjoining minor civil divisions. The data for each individual minor civil division inchuded in such totals can be tabulated separately. however, since earh questionnaire obtained in the fensus contains the designation of the minor civil division in which the farm headquarters was located. An additional charge must be made for a separate tabulation oí any small area included in a total for two or more combined minor civil divisions.

Requests for census information for minur civil divisions should be directed to the Agriculture Division, Bureau of the Census, Washington 25, I.C.

## DEFINITIONS AND EXPLANATIONS

Descriptive Summary and References.-The definitions and expianations that follow relate only to those items that are considered to be inadequately described in the tables where they appear. Although the descriptive terms and explanations refer Specifically $t_{1}$, the 19.6 Census of Amriculture, many of them also appls to earlier censuses. Most of the definitions consist of a resumé of the questionnaire wording, suphlemented by excerpts from instructions gicen to enumerators. For exact wording of the questions and of the instructions included on the questionhaire, see the facsimile of the 1959 Agriculture Questionnaire in the appendix of this report.

An analysis of the questions asked in the 1959 census, and of the data ohtained, is given in Vomme II, General Remort, Statisties by Subjects, United States Census of Agrieulture, 1959. The general report mresents statistics for States by subject matter.

## General Farm Information

Census Definition of a Farm.-For the 1959 Census of Agriculture, the detinition of a farm was based Irimarily on a combination of "acres in the place" and the estimated value of agricultural products soll.

The word "place" was defined to inctude all land on which agricaltural operations were conducted at any time in 1959 under the control or supervision of one person ur partnership. (For definition "f ":rricultural operations". see l. X.) Control may have been exercised throngh ownership or management, or through a lease, rental, or croping arrangement.

Places of less than 10 acres in 1959 were counted as farms if the estimated sales of asricultural products for the year anounted to at least \$20. Places of 10 or more acres in 1959 were counted as farms if the estimated sales of arricultural produets for the year amounted to at leasi soo. l'hases having less than the $\$ 50$ or $\$ 20$ minimum estimated sales in 19 an were also counted as farms if they could normalls be expected to prombe agricultural Irofucts in sufferent quantity to meet the requirements of the definition. This additional gualitication resulted in the inchusion as farms of some places engaged in farming oprations for the tirst time in 1959 and plares afferted ly (rop fallure or other unusual conditions.

To avoid biases arising from an emmerator's personal judgment and opinion, the Burean did not give ennmerators the defini-
tion of a farm. Instead, enumerators were instructed to olbtain questiounaires for all places consitered farms by their nerators and for all other places that hat one or more agricultural operations. (See "Agricultural Operations", p. X.) in itst, enumerators were instructed to fill questiommaires on the same basis as in 1959. In 1950, agricultural operations were defined to inchude every place of 3 or more acres, whether or not the operator comsidered it a farm, and every wace having "specialized opratiuns", regardless of the acreage. "Specialized operations" referred to nurseries and greenhouses and to places having 100 or more poultrs, production of 300 or more dozen eggs in 1949, or 3 or more hives of bees. In all of the three last cemsuses, ats a result, questionnaires were tilled for a considerable nomber of places that did not qualify as farms. The determination as to which questionnaires represented farms was made during offce processing operations and onls those questionnaires meeting the eriteria for a farm were included in the tabulations.

For both the 1950 and 1954 Censuses of Agriculture, places of 3 or more acres were counted as farms if the anmal value of agricultural products, whether for home use or fur sale but exclusive of home-garden products, amounted to $\$ 150$ or more. Places of less than 3 acres were counted as farms only if the annual sales of agricultural prodncts amounted to $\$ \$ 50$ or more. A few places with very low agricultural production because of unusual circumstances, such as crop failure, were also counted as farms if they normally could have been expected to meet the minimum ralue or sales criteria.

In the censuses from 1025 to 1945 , enumerators were given a definition of "farm" and were instructed to obtain reports only for those places which met the eriteria. According to this definition, farms included all places of 3 or more acres, regardless of the quantits or value of agricultural production, and piaces of less than 3 acres if the value of agricultural products, whether for home use or for sale, amounted to $\$ 250$ or more. Because of changes in price level, the $\$ 250$ minimum resulted in the inclusion of varying numbers of farms of less than 3 acres in the several censuses taken during this period. Generally, the only reports excluded from tabulation were those taken in error and those showing rers limited agricultural production, such as only a small bome garden, a few fruit trees, a small lock of chickens, etc. In 1945 , reports for places of 3 acres or more were tabulated only if at least 3 acres were in cropland and/or pasture or if the ralue of products in 1944 amounted to at least $\$ 150$.

The decrease in the number of farms in 1950 and 1054 , as compared with earlier censuses, was partly due to the change in farm definition, especialls with respect to farms of 3 or more aeres in size. Some of the places of 3 or more acres that were not counted as farms in 1950 and 1954 becanse the value of their agricultural production was less than $\$ 150$ would have qualified as farms if the criteria had been the same as in earlier censuses.

For 1959, the decrease in the number of farms as compared with all prior censuses resulted partly from the change in farm definition. The fact that sales of agricultural products in 1959 was used resulted in the exelusion of some places that would have qualified as farms had the value of agricultural products alone been considered. The increase in the acreage minimum also had an effect. The reduction in the number of farms due to change in definition, 1954 to 1959 , is shown for each county In county table 1. Some characteristies of the places not counted as farms in 1959 , but which would have been included in 1954 , are shown in State table 10.

The change in farm definition made in 1950 and again in 1959 had no appreciable cffect on the totals for livestock or crops because the places affected by the change ordinarily accounted for less than 1 percent of the totals for a given county or State,

For the States that comprise the conterminous United States, two figures are publisbed for each county on the number of farms
in 1959. One is an actual connt of an fams and the other is an estimate based on the number of farms induded in the sample. For almost every county there is a difforence between the actual number of farms and the estimated number of farms. Redause of sampling procedure and sampling variabilits, the momber of farms in the sample seldom agrees exactly with the atual number of farms. For most comoties, the actual mumber of farms in the sample was enthor more or less than precisely 20 perefot of all farms. Similarly, totals estimated on the basis of data for the sample farms may be slightly more or sliuthty lows than the actual totals that wonld have been obtained had the data been tabulated for all farms. Therefore, the estimatod mumber of farms reporting curatin itoms may, in some instances he greater than the total number of farms shown in combty talle 1. However, the estimated mumher of farms is wivel in colonty tables 5 and 6 so that estimates basea on the samble farms may be related to the estimated rather than the actual number of farms.

Farm operator. - The term "farm operatur" is unch to designate a person who operates a farm, either doing the worl himself or directly supervising the work. Ife mar be the owner, a member of the owner's honsehold, a hired manager, or a tenant, renter, or sharecroper. If he rents land to others or has land worked on shares by others, he is considered as nperator only of the land which he retains for his own operation. In the ase of a partnership, only one partner is cumbed as an operator. The number of farm operators is considered to be the same as the number of farms.

Farms Reporting or Operators Reporting. - Fisures for farme re porting or oprators reporting. hased on a tabulatim of all farms. represent the number of farms, or operators, for which the specified item was reported. For example, if there were 1,0 farms in a county and only 1 , 4 ha had chickens 4 months ohd and aver on hand at the time of enomeration, the number of farms reporting chickens would be shown as 1,465 . The differeace between the total namber of farms anf the mumber of farms reporting a partioular item redresents the number of farms not having that item, prowided a correct repurt was received for all farms.

Where applicalle, figures may be given for the number of farms or operators not reporting items that were intended to be whtained for all farms; for example, residence of farm oplerator, State table 4 . The number mot remoting. as compared with the total number of farms or arerature, indiates the extent of incompleteness of the reporting of the data tor the item.

Land Area.-The aproximate total land area of Slates and counties as reported for 19 as, in seneral, the same as that reported for all censuses beginning with 1940. Such lifferences as are shown reflect politital changes in bomdaries or actual changes in land area caused by changes in the number or size of reservoirs, lakes, streams, ete. For Alaska, the areas for election districts represent the gross area of land and water.

Land in Farms.-Except tor managed farms, the land to be included in eath farm was determined from the answers to questions about the number of acres owned, the number of acres rented from others or worked on shares fur others, and the number of acres rented to others ur worked on shares by uthers. The acres owned and the acres rented from others or worked on shares for others were first added tugether and then the acres rented to others or worked on shares bs others were subtractod. The result represented the number of acres in the farm. The number of acres in a managed farm was the difference between the fotal land managed and that fart of the managed land that was rented to others or worked on shares by others.

In the 1009,1054 , and 1900 censuses, emmarators were instructed to record total tigures for land owned, land rented from others, and land managed for others, including any part of the land that was rented to others. In coususes prinr to 1 持0, enu-
merators were instructed to cxclude all land rented to others and to record only that purtion of the acreage owned, rented from others, or managed for others that was retained hy the farm onerator. Thus, the figures for the individual tenures of land are not entirely comparable for all censuses. However, the land included in each farm was determined on essentially the same basis for all censuses.

The acreage designated in the tables as "land in farms" consists primarily of "agricultural" land-that is, land used for crops and pasture or grazing. It also includes considerahle areas of land not actually under dultivation nor used for pasture or grazing. For example, the entire acreage of woodland and wasteland owned or rented by farm operators is included as land in farms, unless it was being held for monagricultmral purposes or unless the acreage was unusua3ly large. For 1959 and 1954, if a place had 1,000 or more acres of woodland not pastured and wasteland, and if less than 10 percent of the total acreage in the place was used for agricultural purposes. the acreage of woodland not pastured and wasteland was reduced to equal the acreage used for agriculture. The procedure used in 1950 for excluding unusually large acreages of woodland not pastured and wasteland differed slightly from the one used in 1959 and 19.54 . In 1950 , adjustments were made in places of 1,000 or more acres ( 5,000 or more in the 17 Western States), if less than 10 percent of the total acreage was used for agricultural purposes.
Except for olen range nod grazing land used under gorernment permit, all grazing land was to he inclubed as land in farms provided the place of which it was a part was a farm. Grazing land operated by Grazing Associations was to he repurted in the name of the person ehiefly responsible for conducting the business of the Association. Land used rent free was to be reported as land rented from others. All land in Indian resersations that was used for growing crops or grazing livestock was to be included. Land in madian reservations that was not reported by individual Indians and that was not rented to non-Indians was to be reported in the name of the cooperative gromp that used the land. In some instances, an entire Indian reservation was reported as one farm.

Land owned.-All land that the operator and/or lis wife held under title, purchase contract, homestead law, or as heir or trustee of an undivided estate at the time of enmueration is considered as owned.

Land Rented from Others.-This item includes not only land that the operator rented or leased from others but also land he worked on shares for others and land he occupicd rent free. Grazing land used under government permit or license is not included.

Land Rented to Others,-This item includes all land rented or leased to others, except land leased to the gorermment under the Soil Bank, and all land worked by others on shares or on a rent-free basis. For the most part, the land rented to others represents agricultural land but it also includes land rented for residential or uther purposes. The tenant or shareeropper is eonsidered as the operator of land leased, rented, or worked on shares even though his landlord may supervise his operations. The landlord is considered as orerator of ouly that portion of the land not assigned to tenants or eroppers.

Land Managed.-Thls item includes all tracts of land man aged for one or more emplosers by a person hired on a salary basis. A hired manager was considered to be the operator of the land he managed since he was responsihle for the agricultural operations on that land and frequently supervised others in performing those olerations. Managed land was always to be reported on a separate questionnaire whether or not the manager also olerated a farm on his own account.

Land in Two or More Counties.-An individual farm was always enumorated in only one comnty, even in cases where the land was lucated in two or more connties. If the farm operator lived on the farm, the farm was enmmerated in the connty where he lived. If he did not live on the firm, the tigures for the farm were talmbated for the countr whore the farm headquarters was lowated. In cases where there was any question as to the locition of the headquarters, fivues for the farm were tabulated fur the county where most of the land was located.

Land in Farms According to Use.-Land in farms has been distributed according to the way in which it was used in 1959. The land uses described in the following paragraphs are mutually exclusive; that is, each acre of land is included only once even though it may lave had more than one use during the year.

Cropland Harvested.-This category refers to all land from which any crops were harvested in 1959, whether for home use or for sale. It inthules land from which hay (including wild hay) was cut and lamd in berries and other small fruits, orchards, vinevards, nurseries, and greenhouses. Natured crops homged off or grazed were considered to have been "crops harrested" and were reported here. Land from which two or more erons were harvested in 1959 was to be counted only once in the land-usc classifiration. Land used for other purposes either heftre or after the crops were barvested was to be reported as cropland harvested, without regard to the other uses.

The enmmeratur was instructed to check the figure for cropland harvested for each farm by adding the acreages of the individual crons and subtracting the acreages from which two or more crops were harvested. This checking procedure was repeated during the office processing of questionnaires for all farms having 100 or more acres of cropland harvested.

Cropland used only for Pasture.-This land-use classification includes rotation pasture and all other land used only for pasture or grazing that the operator considered could have been used for erops withont additional improvement. Enumerators were instructed to include land planted to crops that were hogged off, pastured, or grazed before maturity but to exclude land pastured hefore or after hay or other crops were harsested from it. Permanent open pasture mas have been reported either for this item or for "other pasture" depending on whether or not the operator considered it as cropland.

The figures for 19 th $^{5}$ and earlier censuses are not entirels comparable with those for the last three censuses. For 1945. the figures include only cropland used solely for pasture in 1944 that had been plowed within the prcceling seven years. The figures for 1940 , 1935 , and 1925 are more nearly comparable with those for 1959,1954 , and 1950 , however, because they include land pastured that conld have heen howed and used for crops without additional clearing, draining, or irrigating.

Cropland not Harvested and not Pastured.-This classification represents a total of three subclasses for the IT Western States and two subclasses for other States.

Cultivated Summer Fallow.-This suhelass of land is shown only for the 17 Western States. It refers to cropland that was plowed and cultivaled hut left unseded for the 1959 harvest in order to control weeds and conserve moisture.

Soil Improvement Grasses and Legumes.-Vor the 1!nis and
 be plowed mader for ereen mamore is tabmatad serarately from "other (rondand". Alter the estahlishment of the Soil Bank, land that would mormally have becol used for otley purposes was frepuently phated to suib-imporement rops. In eomuties where lame andeages were pated in the soil Rank, the total of land used for soil-improverment crops phas "other crobam" maty be comsiderably larger than the "other cropland" shown for previous censuses.

Other Cropland.-This subelass includes idle cropland, land in erops intanded for harvest after 1959, and cropland not harvested becimse of eomplete erop fallure, low prices, labor shortage, of other reasons. The 195: figures for "other cropland" are not entirely comparable with those for previous rensuse's since thes do not include land used only for soil-improvement crops. (See preceding paragraph.)
Woodland Pastured.-This classification includes all woodland where livestock were pastured or grazed in 1959 . The instruction on the questionnaire - Include as woodland all wood lots and timber tracts; entover and defnested land which has value for wood products and has not beren improved for pasture"-represents a somewhat more precise deflition than the corresponding instruction contained on the felst questionmaire. No defintion of woolland was given in $19 \pi 0$ apart from an instruction to enumerators mat to include hrash pasture as woodland. Some of the changes in woodland acreates from one census to another may merely rebresent differences in interpretation as to what constitutes "wordtand."

Woodland not Pastured.-This classification rufers to all Womaland not used for basture or grazing in 1:1\%9. including land in operatud fams that was flared in the Soil lank ama planted to treas. Umosually largn tracts of timberband that were reported as woodiand not pastured were excluded from
the tabulation of land in farms when it was evident that soch land was held primarily for nonagricultural purposes.

Other Pasture.-This classification refers to all land nther than woodland and cropland that was nsed only for pasture or grazing in 1959. It includes noncrop open or brush basture and cutover or deforested land that has been improved and used for pasture. The figures for the last three censuses are comparable but those for $19+5$ include all monwoothand pas ture that had not been plowed during the preceding seven years. For the 1940 census and earlier years, the figures are more nearls comparable with those for the last three censuses. However, the classification may be somewhat less inclusice because land that could have been plowed and used for crops without additional clearing. draining, or irrigating was classified as plowable pasture and ineluded with "cropland used only for pasture".

Improved Pasture.-This sulclass refers to that portion of "other pasture" on which one or more of the following practices had been used: liming, fertilizing. seediug, irrimating. draining, or the clearing of weed or brush growth. The figures are comparable with those for 1954, when the question on improved pasture was asked for the first time.
other Land.-This classification refers to all land not included in the preceding land-use classifications, such as house lots, barn lots, lanes, roads, ditches, land area of ponds, and wasteland. This figure for 1959 was obtained from the machine tabulations by subtracting the total of all other uses from the total land in all farms reported for a given country or classification. Hence, there is no figure given to represent the farms reporting this item.
Value of Land and Butldings.-Only average values of land and buildings per farm and per acre are presented in this report. They are estimates based on data obtained for sample farms. Estimates of the total value of land and buildings by States, geographic divisions, and the United States, are presented in rolume II.

The enumerator was instrncted to record the market value of the land and the buildings on that land. Market value was defined as the price which the farm operator would expect to receive for the land and buildings if he were to sell them on the day of enumeration.

More problems and difficulties arise in the enumeration of farm-real-estate values than in the enumeration of most other agricultural items. Most of the items enumerated require the respondent to make a statement of fact. For example, information about the number and value of farm animals sold alive during the year is based on actual transactions. Similarly, information about livestock inventories relates to the situation existing on a specific place at a specifie time. Reports concerning the ralue of land and buildings, however, are estimates based almost entirely on opiniou. The majority of farms have not changed hands for many years and are not currently for sale. For such farms, the operators are not likels to have any clear basis for estimating the value. To make an intelligent and objective estimate, a respondent first needs to make an estimate of the prevailing average market value of farms in his community. Then, he must either add to or subtract from that estimate to allow for the different characteristics of his own farm. In many eases, an operator who would not sell his farm under any circumstances may report an unreasonably high market value. In other cases, a farm operator wbo acquired bis real estate during a period of relatively low prices may estimate an unrealistically low value by current standards. Because of the extent of variation that is known to exist in real estate values, it is difficult to devise eheeking procedures that will identify inaccurate estimates.

Age of Opcrator.-Farm operators were classified by age into six age groups. The average age of farm operators was derived from the sum of the ages of all farm operators reporting age divided by the number reporting. The number of farm operators 65 or more years of age is an actual count based on the operators reporting age.

Residence of Dperator. - Varm onerators were datitind by resi. dence according to whether or not they lived on the farms they were operating. Some of thase who did not live on the farms they opreated themselves lived on farms oferated by others. In cases where all the land was rented frum others or work on slares for others, the operatur was consitlerd to lisw om the farm operated provided the dwelling he omenpied was included in the rental agreement. The dwelling, in such cases, was mot necessarily on the land being opreated. Similarly, a farm operator who did not live on the land being cultirated or krazed but who had some agricultural operations (other than a home garden) at his dwelling was considered as living on the farm operated.

Since some farm operators live on their farms only during a part of the year, comparahilits of the figures for various censuses may be affected bs the date of enumeration.

In a few cases, the enumeritor failed to report the residemce of the farm operator. Differences between the total mumber of farms and the number of farm onerators classified by residence indicate the extent of under-reporting.

Year Began Operating Present Farm.-Enumerators were instructed to report the year during which a farm operator began to operate his present farm and, if the sear was 1958 or later, also to report the month. The sear was intended to refer to the first year of the period during which the olerator had been in continuous charge of his present farm or of any part of it. The time of year that farmers move is indicated by the month they began operating their farms, as shown by a monthes breakdown of the reports for farmers who began operating their present farms during 1958 and 1959.

Off-Farm Work and Other Income.-To obtain a measure of the extent to whieh farm operators rely on nonfarm sources for part of their income, four questions were asked of all farm operators. The first question asked for the number of dass the operator worked off his farm in 1959. The other three questions, to be answered "Yes" or "No," asked (1) whether other members of the nerator's household did any work off the farm; (2) whether any income was received from sources other than the sale of agricultural products from the farm operated; and (3) whether the combined income of all members of the bousehola from off-farm work and other sources was greater than the total value of agricultural products sold from the farm operated.

Off-farm work was defined to include work on someone else's farm for pay as well as all types of nonfarm jobs, businesses, and professions, whether the work was done on the farm premises or elsewhere. Exchange work was not included.
The questions asked in the 1959 Census are closels comparable with those asked in 1954. The data for 19.9 are actual totals of all operators reporting off-farm work and other incone whereas those for 1954 are estimated totals based on the sample.
Equipment and Facilities.-In 1959 as in several earlier censuses, data about specified equipment and facilities were obtained for only a sample of farns. Farm operators were asked to report equipment and facilities that were on the farm at the time of enumeration, regardless of ownership. They were to include items tbat were temporarily out of order but not any that were worn out.
Data in teris of actual number were obtained for the following items of farm equipment in 1959 : (1) grain combines, (2) eorn pickers, (3) pick-up balers, (4) field forage harvesters, (5) motortrucks, (6) wheel tractors, (7) garden tractors, (8) erawler tractors, and (9) automobiles. Definitions given enmmerators included the following specifications, among others: Corn pickers related to all types of machines used for picking corn, whether used in separate or in combined picking-shelling uperations. Pick-up balers were to include both hand-tie and autnmatic balers but not stationary ones. Motortrucks were to include pirk-up trucks and truck-trailer combinations; jeeps and station wagons
were also to be included if they were used primarils as trucks, but school buses were specifically excluded. Wheel tractors specifically excluded garden tractors, implements with built-in power units, such as self-propelled combines or powered buck rakes, and the power unit of a truck-trailer combination. Automobiles were to include jeeps and station wagons if they were used primarily as passenger cars.

Questions to be answered "Yes" or "No" provided information as to the presence or absence of the following items: (1) telephone, (2) home freezer. (3) malking machine, (4) electric milk cooler, (5) bulk-type milk cooler (in six States onls-Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wiseonsin), (6) crop drier and (7) power-operated elevator, conveyor, or blower.

Comparable data from one census to another are not available for all items. The questions asked about equipment during a giren census reflect changes in farm mechanization and in the facilities available to farm families, Questions about some items of equipment were asked in 1959 for the first time (electric milk cooler, crop drier, bulk-type milk cooler, etc.). Similarly, some questions that were asked in earlier censuses were omitted in 1959. For example, the use of electricity is now so widespread that there is no longer any need for obtaining a count of the farms having it.

Farms by Kind of Road.-The classification of farms by the kind of road on which thes are located is hased on only a sample of farms. The enumerator was instructed to report, on the basis of his own observation, the kind of road on which the most frequently used entrance to the farm was located. For farms consisting of two or more tracts, he was to limit his report to the tract on which the farm operator had his dwelling or other headquarters.

Farm Labor.-The questions about farm labor were asked only for the sample farms and related to persons working during the catendar week preceding the week of enumeration. Since the enumeration starting dates varied by gengraphic areas, aud the enumeration within each area lasted over a period of several weeks, the calendar weeks to which the data apply also vary. Thus, the data for an individual farm may relate to any one week during the months of Octoher, November, or December, or even, in a few instances, to weeks during September 1959 or Janmars 1900.

Farm labor was defined to include any work, chores, or planning necessary to the agricultural operations of the farm ; and to exclude housework, contract construction work, custom machine work, and repair, installation, or construction work done by persons emplosed sperifically for such work. The farm lahor information contained in this report represents estimates based on answers to questions relating to the farm work or chores dune during the week bs (1) operator, (2) unpaid memhers of the operator's family, and (3) hired persons. An opreator was considered as working if he worked one or more hours: unpaid nembers of the operator's family, if they worked $\mathbf{1 5}$ or more honrs; and hired persons, if they worked at all during the week.

Data are not fully comparable from one census to another, primarily heranse of diferences in the period to which they relate. In 19it, the data were purposely related to either one of two calendar weeks, demending in part on the starting date set for the enmmeration and in part on which week represented a period of peak employment within a given state. For the majority of States, the period specified was the week of Selptember 2 -Octuber 2 ; for other States, the week of October 24-; 0 .

In 10.50, as in 1059, the data related to the week preceding the actual enumeration. UnJike 190t, however, emmmeration starting dates were idential for all states in 10 an (April 1) but since several weeks were required to complete the enumeration, the calendar week preceding the enumeration was not identical for
all farms. In 1945 and 1935, the number of farm workers related to the first week in January and, in 1940 , to the last week in March. In 1945, 1940, and 1935, only persons working the equivalent of two or more days during the specified week were to be included. In 1945 and 1940 , an additional specification limited the workers to those 14 years old and over.

Experience gained from carlier censuses indicates that farm labor data are often unsatisfactorily reported unless the week specified is the week immediately preceding the actual enumeration. When a farm operator was asked to report the number of lersons employed during a specified week that was several weeks prior to enumeration, he often reported the highest number of iersons employed during the year. Obviously incorrect reports were adjusted to make the data reflect more nearly the situation known to exist during the specified week. The farm labor data for 1954 relates to a specified week which, in some cases, was several weeks prior to enumeration. Few adjustments were made in those data, however, eren though there were indications of incorrect reporting.

Regular and Seasonal Workers.-Hired persons working on the farm during the week concerned were chassed as "regular" workers if the period of actual or expected employment was 150 days or more during the year. They were classed as "seasonal" workers if the period of actual or expected employment was less than 150 days. In cases where the period of employment was not reported for an individual farm, it was estimated from data for such items as basis of payment, wage rates, expenditures for labor in 1959, and type of farming operations.

Hired Workers by Basis of Payment.-lIired persons were also chassitied according to whether they were paid on a monthly, weekly, daily, or hourly basis, or by piecework. In cases of incomplete reporting, the basis of payment for hired workers was supplied during the office processing operations.

Wage Rates and Hours Worked.-The agreed cash rate of pay was asked for each class of hired worker excent those emplosed on a piecework basis. (The number and the earnings of persons paid on a piecework basis were required for those who worked on Friday of the week preceding the enumeration.) The aumber of hours that workers were expected to work to earn their pay was asked for each class except those employed on an hourly or piecework basis. For 1959 and 19.54, the data include oflice estimates for farms subnitting inemplete reports of wage rates and hours worked. The estimates were consistent with the size and type of operations for the individual farm as compared with similar farms in the area for which complete reports were received. The corresponding data for 1950 apply only to farms that reported both wage rates and hours worked.
Fertllizer and Lime.-The questions abont fertilizer and lime, asked only for the sample farms, relate to the acreage on which fertilizer and lime were used and to the quantity used. Farm operators were asked to report total quantities used in 1959 on the farms they operated regardless of when or by whom the fertilizer and hime were purchased. In the sonth, some landords who operated farms themselves included the fertilizer and lime they had purchased for use on their tenant-operated land. Such fertilizer and lime may also have been reported by the tenants. When double reporting was detected during the editing process, the data on the questiomaires concerned were adjusted to eliminate duplication in the totals.

The 1959 data for tertilizer and lime are entirely comparable with those for 1054 . A breakdown between dry and liquid fertilizing materials was not obtained in 1951 and data on cost of either fertilizer or line were not obtained in 1059.

Fertilizer.-The report for fertilizer was to refer only to commervial fertilizer and fertilizing materiats, including rock phosphate. 'The acres fertilized and the tons of fertilizer apphed to those acres were oltained scparately for selented crops. The setected crops varied by region so that it was possible to ditain detailed data for the crops most commonly fertilized in each regiom. In rases where the same land was used tor nore than one crop, the acres fertilized were to be reported separately for each crop. it the sime crop was thribzed hore than once, however, the acres in that crop were to be reported only once. In all cases, the total quantity of fer-
tilizer used in 19.9 was to be repurted, including quantities used on land oceupied by crops planted in 1458 or the crops to be harrested in 1960.
Reports for quantity of fertilizer and fertilizing materials used were required for hoth dry and liquid materials. The terms "dry" and "liquid" referred to the form in which the fertilizers and fertiluzing materials were purchased and not to the way in which they were appliet. Thus, dry fertilizers were those purchased in dry or solid form, as powders, dusts, granules. pellets, ete.; liquid fertilizers were those purchased in fluid form, as solutions or as liquefled gases.

Lime. The data for lime relate to the total acreage limed in 1959 and the total tonnage of time and liming materials used on those acres for purposes of conditioning the soil. Instructions on the questionaire stated that ground limestone, hydrated and burnt lime, marl, and orster shells were to be included but that lime used for spraying or sanitation purposes was to be omitted.
For some counties, the tomage of lime slown in the table may be less than the tonnage reported for the Agriculture Conservation I'rogram or the Conservation Reserve Program of the Soil Bank. Differences may be due either to sampling error or to under-reporting by farm operators. Many of the differences are minimized or eliminated entirely in the data presented on a State or regional basis.
Specified Farm Expenditures.-The data for farm expenditures are estimates based on reports obtained from the sample farms. The $19: 9$ questionnaire contained questions for six items of farm expenditure: (1) purchase of feed for livestock and poultry, (2) purchase of livestock and poultry, (3) machine hire, (4) hired labor, (5) seeds, bulbs, plants, and trees, and (6) gasoline and other petroleum fuel and oil. With the exception of items (2) and (5), exactly the same questions were asked in 1954. For each item specified, the total expenditures made for the farm in 1959 were to be reported, whether made by the farm operator, his landlord, or both. A farm operator who rented part of his land to others was to report only the expenditures for the land he operated himself. Enumerators were instructed to ask respondents who had difficulty estimating their expenses for the period between enumeration and the end of the year to estimate them on the basis of current costs.

Feed.-The report on feed purchased for livestock and poultry was to include expenditures for grain, hay, millfeeds, pasture. salt, condiments, concentrates, and mineral supplements as well as for the grinding and mixing of feed. The estimated cost of items furnished by a landlord, contractor, or other owner for feeding poultrs and livestock kent on the farm was also to be ineluded. Parments made hy a tenant to his landlord for feed grown on the tenant farin were to be excluded.

Livestock and Poultry.-The cost of baby chicks and turkey poults was to be included in the expenditures made for the purchase of livestock and poultry. Enmmerators were instructed to ask the farm onerator to include the cost or estimated purchase value of poultry and livestock provided by others and cared for bs the operator under a contract feeding arrangement. The cost of livestock purchased for resale within 30 days was not to be included. A short-term transaction of that nature was considered to be a dealer operation, not an agricultural one.

Data on the purchase of livestock and poultry were not obtained in 1954. The instructions for the 1950 census specified that expenditures for domestic rabbits, fur-bearing animals kept in captivity, and bees were to be included. Ans lack of comparability in the 1950 and 1959 data resulting from inclusion or exclusion of rabbits, fur-bearing animals, or bees is considered to be so slight as to be insignificant.

Machine Hire.-Expenditures for machine hire relate to custom machine work, such as tractor hire, threshing, grain or seed combining, silo filling, baling, eotton picking, eotton ginning, corn picking, plowing, vegetable harvesting, fruit picking, spraying, and dusting. Any amount spent for the labor included in the cost of machine hire was to be considered as part of the total expenditure. The cast of freight or trucking and exchange work without pay were to be omitted.

Hired Labor.-Expenditures for hired labor were to include total cash payments made in 1959 to family members and to others for farm labor. Payments to persons sumplied by a contractor or a cooperative organization and paid directly by them or by the crew boss were also to be included. I'ayments
for the following types of work were to be excluded: housework, contract construction work, custom machine work, and repair, installation, or construction work done by persons speeitically employed for such work.
Gasoline and Other Petroleum Fuel and 011.- Expenditures for gasoline and wther petrolemm fued and oil were to relate anly to the produets used in the farm business. Ennmerators were instructed to exchude the cost of petcolemm products used for the family automobile when operated for other than farm business purposes and of products used in the farmmonse for beating, cooking, and lighting.

Seeds, Bulbs, Plants, and Trces.-Expenditures were to represent the total amount spent for seeds, bulbs, plants, and trees to be used on the farm operated. The value of seed grown on the farm was to be excluded. For nurseries and greenhonses, the cost of products purchased for immediate resale was also to be excluded.
This item of expenditure was not included in the 1954 Census. The data are comparable with those for 1950, however.

## Crops

Crops Harvested.-The 1959 agriculture questionnaire was similar to the questionnaire used in several previous censuses in that it provided for the collection of detailed data for all crops harvested on each individual farm. The variation in the crops listed on the questionnaires used in different States made possible the separate reporting of all important crops grown in a given area. All rersions of the questionnaire contained several "All other crops" questions where crops not specifieally listed in separate questions were to be reported.

Acreage of Crops Harvested.-In most instances, the acreage reported for individual crops represents the area harvested during 1959. The area barvested is often less than the area planted. For fruit orchards and groves, vineyards, and planted nut trees, the acreage reported represents the total area in both bearing and nonbearing trees and vines as of the date of enumeration-usually a date in October, November, or December 1999. For sorbeans, cowpeas, and peanuts, the acreage grown for all purposes was reported as well as the acreage harvested for sprecific purposes. For velvet heans, only the acreage grown was reported. As the enuueration was about to begin in South Florida (those counties in which the enumeration was begun on October 7), an instruction was issued to the effect that the data for vegetahles and potato crops should relate to a full year, beginning on October 1, 1958, and ending September 30, 1959.
Quantity of Crops Harvested,--Except for citrus fruits, olives, a vocados, and for regetahle and potato crops in South Florida (see preceding paragraph) data for quantity harvested relate to the calendar year 14.99. For cltrus fruits, the quantity harvested from the bloom of 1958 for the 1958-in9 marketing season was to be reported. For olives, the crop harvested in 1959 was to be reported for all States except California and Arizona. Enumerators in those two States were lastrueted to report olives harvested from the bloom of 1958 during the $1958-$ 59 harvest season (September 15, 1958, to February 28, 1959). In the case of avocados, the data for California were to relate to the quantity harvested from the bloom of 1958 for the marketing season that extended from October 1, 1958 to September 30, 1959; the data for Florida were to relate to the crop harvested for the marketing season that extended from July 1, 1959, to February 28, 1960. Respondents were to estimale quantities not jet harvested at the time of enumeration.
Unit of Measure.-The unit of measure in which quantities were to he reported has varied for some crops, not only from State to State, but also from census to census. The aim has been to permit reporting in the units of measure currently in use. In the State and country tables, the quantities harvested for each crop are usually expressed in the unit of measure given on the 1959 agriculture questionnaire. In 1959 , for corn and Irish potatoes, a choice between two units in which to report the production was given in some States. (See the discussion for those crops.) To provide readily comparable information, data published in earlier reports in different units of measure generally have been converted to the units used in 1959.

Corn.-In the 19.9 census, detailed questions regarding the purpose for which corn was harvested were asked in all States. For most States, busbels was the only unit specified for corn
for grain. In some areas, however, where farmers were not accustomed to using bushels as the unit of measure, the questionnaire contained a provision for the quantity of corn for grain to be reported either in bushels (shelled basis) or in baskets of ear corn. As in former censuses, some reports were received In units of measure other than bushels or baskets. Prior to tabulation, all reports were converted to bushels (shelled basis) on the basis of the fullowing factors: 70 pounds of ear corn, 2 baskets of ears, or 50 pounds of shelled corn equal one bushek. A barrel of ear coln was usually considered equat to 5 bushels of shelled corn.

Annual Legumes.——For soyheans, cowleas, and peanuts, the acres and quantity grown or harvested for suecific purposes, as well as the total acreage grown for all purposes, were obtained for areas where these crols are grown extensively; for velvetbeans, only the total grown for all purposes was obtained. For all these crops extept, possibly peanuts, the total acreage grown for all purposes includes some acreage that was plowed under for green manure. In a few sonthern states, separate figures were ohtained for the acres grown alone and the acres grown with other crops. In 1959, as in 1954, enumerators were instructed to revort green sombeans and blackeyes and other green cowpeas harvested for sale as regetahles and not as annual legumes.

Hay Crops.- Data for the total acres of land from which hay was cut exchude the acreage in sorghum, soybean, cowpea, and peanut hays. These crons were reported in separate questions in the States where they are important. To obtain the total acres from whirh other have were cut, the acres of the various hay crops, including grass silage, were added together for eacb county. The corresponding totals for 1954 were obtained by the same procedure. For the 19.50 census, however, the totals were based on farmers' own reports of their total acreage in barvested hay crops.

The questionnaire contained an instruction that if two or more cuttings were made from the same land, the total production from all cuttings was to be reported but the acres cut were to be counted only once. In cases where both hay and grass silage were cut from the same land, the total acreage was to be reported for both crops. In 19\%, as in 19\%4, alfalfa hay included alfalfa and alfalfa mixtures for hay and for delydrating; clover and timothy hay inchuded clover, timothy, and mixtures of clover and grasses: small grain his included oats, wheat, barley, rye, or other small grains cut for hay. The hay crops listed on the questionnaire varied somewhat from one State or region to another. The kinds of hay to be included in separate questions can be determined for a specific State from reference to the facsimile of the questionnaire that is in the appendix.

The tonnage of liay, lncluding alfalfa hay for dehydrating, is given on a dry-weight basis. Prior to tabulation, production reportad in green weight was converted to its dry-weight equivalent by dividing by 3. However, the production of grass silage is given in terms of green weight.

Field Seed Crops. The field seed crops listed on each version of the questionnaire were limited to those consldered most important within the given State. Each version of the questionnaire contalned space for listing other field seed crops in order to facilitate the reporting of all field seed crops harvested. Quantity harrested was to be reported in terms of clean seed for most field seed cropss. Bluegrass, or Junegrass seed, was to be reported in terms of green seed for Iowa, Kansas, Kentacky, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Tennessea. No mention was malle of "grean-weight basis" for "ther states where this crop was to he reported in the "All other" question.

Irish Potatoes and Sweetpotatoes.-For Irish potatoes and sweetpotatoes (including yams), the total quantity harvested was to be reported for each crop in all cases, whether harvested for
home use or for sale or whether used for livestock feed. The acreage harrested was to be reported for each crop only ln cases where the quantlty amounted to 20 or more bushels (or the approximate equivalent in terms of hundredweights, barrels, or pounds, as explained on different versions of the questlonnalre). This method of reporting was deslgned to facilitate the enumera. tlon of potatoes harvested on small plots for home use. Essentially the same procedure was followed in both 1954 and 1950. In earlier censuses, however, the acreage of Irish potatoes and sweetpotatoes was to be reported in all cases, even when production was solely for home use. Therefore, the data on acres for censuses prior to 1950 are not fully comparable with those for the last three censuses, especially in countles or States where production is largely for home use.

The unit of measure in which quantity was to be reported varied from one State or region to another to correspond with the units most commonly used ln a given area. In 27 States, the questionnaire provided a choice for reporting either bushels or 100 -pound bags (hundredweights). The published data for counties and states are in terms of bushels.

Berries and 0ther small Fruits...The question for berries and other small fruits related specifically to the acreages and quantities harvested for sale. Only tame or cultivated berries were to be reported except for the New England States, where wlld blueberries were also to be lncluded. Enumerators were instructed alwass to report the total quantity of each kind of berry liarvested for sale but to report the area harvested only when lt amounted to one-tenth acre or more. Nonbearing areas and areas and quantities harvested for hone use were to be excluded. The data for 1959 and 1954 are fully comparable.

Tree Fruits, Nuts, and Grapes.-In 1959, as $\ln 1954$, fruit trees, nut trees, and grapevines were not enumerated for farms having a combined total of less than 20 at the time of enumeration. Both bearing and nonbearling trees and vines were to be included but not any that had been abandoned. For censuses prior to 1954, all fruit or out trees and grapevines on the farm were to be enumerated, regardless of the number. Because of thls change in enumeration procedure, the data for 1959 and 1954 are not fully comparable with those for earlier censuses. In commercial fruit-producing counties, the change $\ln$ procedure may have had a considerable effect on the number of farms reporting wlthout causing any signlficant changes in the number of trees and vines nor in the quantity harvested. In countles where most of the trees or vines are $\ln$ small plantings and where production is largely for home-use, however, the change may have caused a slgnificant reduction not only in the number of farms reporting but also in the number of trees and vines and in the quantity harvested.

In both 1959 and 1954 , the area ln frult orchards, groves, rineyards, and planted nut trees was enumerated when there were 20 or more frult trees, nut trees, and grapevines. In 1950, the corresponding area was enumerated only if it amounted to one-half acre or more. In censuses prior to 1950 , the area was to be reported regardless of its size or of the number of trees and vines. Enumerators frequently omitted the fractional acreages in small plantings and home orchards, however. In some counties, small plantings or home orchards comprise a sizeable proportion of the total frult and nut acreage. For those counties, the change from one census to another In acreage of land in fruits and nuts may not be due to fact but merely to differences in enumeration.

In 1950, California was the only State for which the acreage in each individual fruit and nut crop was obtained. In 1954, such acreage was also obtained for Arizoua. In all States, the number of bearing and nonbearing trees or vines on the farm at the thme of enumeration and the quantity larvested In 1959 were to be reported separately for each fruit and nut crop. (Exceptlons in the harrest period for citrus fruits, avocados, and
olives are described on p. XLX.) The mit of measure in which quantities were to be reported varied from one state to another. Tables in this report show quantities in the unit of measure appearing on the $19 \pi 0$ questionnaire used in the State.

Nursery and Greenhouse Products.-The questions about nursery and greenhouse products related only to products grown on the place for sale. Crops hought for resale withont additional cultivation were to be excluded. The area used for growing and the ralue of sales were to be reported separately for each of three groups, as follows :
a. Nursery products, (trees, shrubs, vines, ad ornamentals).
b. Cut flowers, potted plants, florist greens, and bedding ptants. For these items, the area grown in the open was to be reported separately from the area grown under glass.
c. Vegetables grown under glass, flower seeds, vegetable sceds, vegetable plants, bulbs, and mushrooms. For these items, the area grown in the open was to be reported separately from the area grown under glass or in the house.
The data obtained for 1959 are comparable with those for 19-4 and 1950 since the questions asked were essentially the same in the three censuses. Detailed data regarding the prodnction and sale of nursers, greenhouse, and other horticultural products on farms having sales of $\$ 2,000$ will be published in volume $V$, part 1 .

Forest Products.-The forest products data olitained in the Census of Agriculture relate only to the products cut on farms. Commercial logging, timber operations, and forest products grown or cut on nonfarm places are excluded. Therefore, the data $\ln$ this report do not represent the total forestry output or income for a county or State.

The questions included on the 19.99 agriculture questionnaire are more detailed than those asked in the 1954 Census. Value was obtained for the sale of standing timber or trees and for the sale of poles and piling, bark, bolts, and mine timbers. The quantity cut, whether for home use or sale, and the quantity sold were obtained for individual forestry products such as firewood and fuelwood, fence posts, sawlogs and veneer logs. Data relating to pulpwood, Christmas trees, maple trees, and maple syrup were obtained in states where such products are important commercially.

Value of Crops Harvested.-The total ralue of erops inarvested represents the estimated value of all crops larvested during the crop year 1959 . It includes the value of quantities consumed on farms as food, feed, seed, etc., as well as quantities sold. Farmers were not asked to report values of crops harvested; the ralues were calculated in the lrocessing Othice. For individual crops, the quantity harvested was multiplied by the arerage price at which the crop was sold in the State. State average prices were furnished to the Bureau of the Census by the Agricultural Marketing Service of the U.S. Department of Agriculture. They are based on reports received from a sample of farmers and dealers. Quantities harvested were not obtained for vegetables nor for nursery and greenhouse products. Therefore, for those crops, the value of sales, as obtained in the enumeration, was used in the calculation of total value of crops harrested.

Value of Crops Sold.-The questionnaire required value of sales of crops to be reported only for total vegetables, nursery and greenhouse products, and certain forest products. For all other crops, the ralue of sales was calculated on a county level during processing operations by multiplying the State average prices by eitber the quantity sold or the quantits harrested. Reports of quantity sold were obtained during the enumeration only for some of the major fleld crops. Quantity harvested was used in the calculation of ralue of crops sold for such crops as cotton, tobacco, etc., that a re customarily grown for sale. The procedures used for the various crops are described on page XXV. They
are similar to the procedures followed in 1954. In 19\%0, ralues of crops sold were obtained for each farm during the enumeration.

## Ibbigation

Definition of Irrigated Land.-lrrigated land is defined as land watered for agricultural purposes by artiflial means. Thest means included subirrigation as well as systems whereby water was applied to the ground surface, either directly or by sprinklers. Land flooded for rice cultivation was considered as irrigated. Land flooded during high-water periods was to be included as irrigated only if water was directed to agricultural use by dams, canals, or other works. The definitlon of irrigated land specifically excluded land where the "water table", or natural level of underground water, was controlled by drainage works with no additional water brought in by canals or pipes.

Enumeration of Irrigated Land.-A question on total land irrigated was asked in all States, with the exception of Alaska. The acreage reported for this question includes not only irrigated cropland but also any other land that was Irrigated in 1959.

The questionnaires used in the 17 Western States, Louisiana, and Hawaii included several additional questions regarding irrigation. These questions related to the acreage of land irrigated by sprinklers, irrigated land from which crops were harvested, specific crops irrigated, and source of irrigation water. Such additional data, for irrigated farms, are presented in county table Ia for these States.

Statistics on the irrigation enterprises which supplied irrigation water were collected in the 1059 Census of Irrigation and are published in Volume III, "Irrigation of Agricultural Lands". This report contains a considerable amount of data about irrigation for the 17 Western States and Loulsiana.

Irrigated Farms.-All farms reporting any land irrigated in 1959 are counted as irrigated farms.

Land in Irrigated Farms.-Data for land in irrigated farms ac. cording to use relate to the entire acreage in these farms, including land that was not irrigated.

Land Irrlgated.-Data for land irrigated relate only to that part of the land in irrigated farms that was watered by artificial means at any time in 1959. Separate figures are given for farms reporting land irrigated by sprinklers whether or not the land was also irrigated by otber means. Additional tigures are given for farms reporting land irrigated by sprinklers only. Data on sprinkler irrigation were not obtained in the 1954 census.

Irrigated Cropland Harvested.-The data for irrigated cropland harvested relate to all irrigated land from which crops were harvested in 1959 , regardless of the method of irrigation. An instruction on the questionnaire reminded enumerators and respondents to include irrigated land from which hay was cut, irrigated land in hoth bearing and nonbearing fruit and nut crops, and irrigated land from which volunteer crops were harvested. Each irrigated acre was to be reported only once, regardless of how many crops were harvested from it.

Other Irrigated Land.-Thls classification was obtained by subtraction of the acreage of irrigated cropland harvested from the acreage of total land irrigated. It represents primarily lrigated cropland not harvested and irrigated pasture or grazing land.
Farms Irrigated By Number of Acres Irrigated.-All farms on which any land was irrigated in 1959 are classified according to the number of acres irrigated in countr table Ia for the 17 Western States, Lonisiana, and Hawaii. This classification is based on total land irrigated. Therefore, lt includes not only the irrigated laud from which crops were harvested but also all other irrigated land, regardless of use.

Land Irrlgated By Source of Water.-The agriculture questlonnaire contained a question as to what proportion of irrigated water used on the farm $\ln 1959$ was obtained from groundwater, surface-water, and Irrigation-organization sources. Respondents were asked to report separately the percentage of
water obtained from each source. The number of acres that were irrigated by water from each source or combination of sources was calculated during office processing operations by applying the percentages to the total land irrigated.

Ground-water sources relate to wells (pumped or flowing) and springs; surface-water sources relate to streams, lakes, reservoirs, and sewage and drainage ditehes. For each of these sources, only water obtained by pumps or other works operated as part of the operator's own farm or as part of another single farm was to be included. Irrigation-organization sources relate to irrigation enterprises organized to supply water to a group of farms, regardless of how or where the enterprise obtained the water. The irrigation enterprise may be a legal organization or a group of farmers informally organized to operate a supply ditch or other works to provide water for their own farms.

## Land-Use Practices

Summary Information.-The 1950 data for land-use practices are estimates based on reports obtained from only a sample of farms. Comparable data are not presented for 1954 because questions about land-use practices were included on the 1954 questionnaire for only a limited number of States. The various land-use practices relate to methods for reducing soil erosion, either by improving the soil, controlling the run-off of water, or reducing the blowing of topsoil.

Cropland in Cover Crops.-The data relate to land on which cover erops were turned under for green manure in 1959 and which was then planted to another erop. The entire acreage of cover crops so used was to be reported even if the following crop failed.

Cropland Used for Grain or Row Crops Farmed on the Contour.This item relates to land on whieh grain or row crops were planted in level rows around the slope of a hill.

Land $\ln$ Strip-Cropplng Systems for Soil-Erosion Control.-Stripcropping was defined as the practice of alternating close-sown crops with strips or bands of row crops or of alternating either close-sown or row crops with bands of cultivated fallow land. The published data refer to the total acreage of all fields and tracts in which strip-cropping was practiced in 1959.

System of Terraces on Crop and Pasture Land.-This item relates to the acreage in ridge-type or cbannel-type terraces constructed on sloping cropland and pastureland.

## Livestock and Poultry

Inventorles.-Data for livestock and poultry on farms relate to the number on hand at the tine of enumeration. All livestock and poultry, including those being kept or fed under contract, were to be enumerated on the farm or ranch where they were, regardless of who owned them. Livestock ln transit from one grazing area to another or grazing in natlonal forests, grazing districts, open range, or on land used under permit were to be reported as being on the place where the person who had control over them had his headquarters.

The tlme of year at which livestock and poultry are enumerated affects the data. Therefore, the date of enumeration needs to be considered when totals for the various censuses are compared. Both the 1959 and the $19 \overline{4} \pm$ census data represent fall inventories. These censuses came at a time of large-scale movement of flocks and berds from one range to another, from ranch to feed lot, and from farm or ranch to market.

The censuses of $1920,1925,1935$, and 1945 were taken as of January 1 and those of 1930, 1940, and 1950, as of April 1. A count made in April varies consillerably from one made in January. In most areas a large number of animals are born between Junuary and April. A considerable number of older animals die or are sold durlng the same perlod. In the range States, along
with the change in season and grazing condition, sheep and cattle are moved from one locality or county to another. This movement may affect the comparability of data for counties and, in some cases, fur States. The comparability of data by age has been affected also by changes in the questions from one census to another.

Milk Cows, Cows Milked, Milk Produced, and Butter.-Data on the number of milk cows, rows milked, and milked produced relate to the day rreceding the enmmeration. Data for butter churned were obtained only fur 14 States and relate to the calendar week preceding the enumeration. The data for cows milked yesterday and milk producell yesterday are not given in this volume. These figures were obtained primarily to serve the needs of the U.S. Department of Agriculture in making monthly and annual estimates of milk production. These figures can be made available, at a small cost, to others who express an interest in them.

Whole Milk and Cream Sold.- Mata for whole milk and cream sold relate to the entlre year 1959 and are estimates based on reports obtained for farms in the sample. All milk and cream sold from the farm (except quantlies purchased from some other place and then resold) were to be included, regardless of who shared the receipts. The questionnaire provlded three alternative units of measure for reporting the quantity of milk sold-pounds of milk, gallons of milk, and pounds of butterfat. The respondent was thus permitted to report quantity according to the unit of measure in which payment was received. In the State and county tables, the data for milk are given in the unit of measure most commonly used in the State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of milk as shown by data furnished by the Agricultural Marketing Service of the U.S. Department of Agriculture.

Sows and Gllts Farrowing.-In the 1959 census, data were obtained for the number of litters farrowed between December 1 , 1958, and June 1, 1959, and from June 1 to December 1, 1959. In the 1954 census, data were obtained for the sows and gilts that farrowed rather than for the number of litters.

Sheep, Lambs, and Wool.-In the 1959 census, questions about sheep, lambs, and wool were asked in all States. Data on shearings and on amount of wool shorn were obtained for lambs and sheep separately. In the 1954 census, sheep and lamb Inventories were not obtained for Florida, Georgia, and South Carolina.

Goats and Mohalr.-In 1959, questions on goats, kids, and mohalr appeared on the questionnaires for the following nine States: Arizona, Callfornia, Missouri, Nevada, New Mexico, Oklahoma, Oregon, Texas, and Utah. In 1954, corresponding data were obLained for Louisiana, New Mexico, Oklahoma, Oregon, Texas, Washington, and selected countles in Missourl.

Bees and Honey.-No questions on bees and honey were included on the questionnatres for either the 1959 or the 1954 census. In 1959, bowever, enumerators were instructed to obtain agriculture questionnaires for places not having agrlculturai operations if they were engaged in beekeeping. The number of hives of bees and the amount of boney sold were to be rejorted in the "Remarks" space of the questionnaire. Data for bees and honey are not included in this report.

Value of Livestock on Farms.-To obtain the value of livestock on farms, the number of each class of livestock or poultry on hand was multiplied by the State average urice for 1959 , as furnished by the Agrleultural Marketing Service of the U.S. Department of Agriculture. Comparable data for $105 \pm$ were compiled by the same method on the basis of average prices for that year.

Sales of Live Animals.-bata for the number and value of animals sold alive in 1950 are estimates based on reports for sample farms only, Corresponding data for $195 \pm$ were obtained for all farms. The dollar value of sales was obtalned from the farmer
for cattle, calves, and horses and mules. Average value per head for other livestock sold was obtained from the U.S. Department of Agriculture. In the 1959 census, respondents were asked to report separately the number of live animals alreaty sold and the number estimated to be sold between the time of enumeration and the end of the year. This separation of reports for the number sold and to be sold was designed to assure more complete coverage of all livestock sales made during the year. In the 1904 census, only totals for the entire year were obtained though reference was made to animals to be sold between enumeration and the end of the year.

Sales of Poultry and Poultry Products.-For both the 1959 and the 1954 Censuses, sales of chickens were obtained for two groups: (1) broilers and (2) other chickens. The enumeration of broiler sales presents problems arising from the varied contractual arrangements under which broilers are produced. The questionnaire contalned an instruction to the effect that all broilers grown for others under contract were to be reported as sold. During office processlng operations, the data reported for inventories and sales of chickens four months old and over, chicken eggs sold, and brollers sold were carefully examined. Obvious inconsistencies Indlcating confusion between broilers and other chickens were corrected on the basis of estimated values and, for sample farms, on the basis of data reported for expenditures for feed, poultry and livestock purchases, bired labor, etc.

Questlons relating to poultry other than chickens (and brollers) were generally the same $\ln 1959$ as $\ln 1954$. In the 1959 census, however, only total numbers were obtained for turkers and turkey fryers ralsed and for turkey bens kept for breeding whereas the 1954 questionnaire asked for a breakdown between light and heavy breeds. Also, for poultry other than chickens and turkeys, the 1959 census obtained the number sold whereas the 1954 census obtained the number raised.

## Classification of Farms

Scope of Classification.-Data for land in farms, and for cropland barvested in farms classifled by size, by color of operator and by tenure of operator were tabulated for all farms. However, most of the detailed data by size of farm, by color of operator, by tenure of operator, by economlc class, and by type of farm are estimates based on farms in the sample. The farm classifications by size of farm, color of operator, tenure of operator, economic class of farm, and type of farm were made in the processing office on the basis of data reported on each questionnaire.

Farms by Slze.-Farms were classified by size according to the total land area established for each farm. The same classification was used for all States. According to definition, a farm is essentially an operating unit, not an ownership tract. All land operated by one person or partnership represents one farm. In the case of a landlord who has assigned land to cromers or other tenants, the land assigned to each cropper or tenant is considered a separate farm even though the landlord may operate the entire landholding as one unit in respect to supervision, equipment, rotathon practlce, purchase of supplies, or sale of products. In some parts of the South, a special Landlord-Tenant Questionnaire was used to assure an accurate enumeration of each unit within a multiple-unlt operation. A change was made in the size classification for 1959, as contrasted with several preceding years, by subdividing the 1,000 -acre-and-over group and by combining two previously recognized groups, viz., 10 to 29 acres and 30 to 49 acres.

Farms by Color of Operator.-Farms were classified by color of operator into two groups, "white" and "nonwhite." "Nonwhite" includes primarlly Negro and Indian operators but also some of other raclal orlgln.

Enumerators were instructed to report the race on the basis of their own observation whenever possible rather than by asking the respondent.

Farms by Tenure of Operator.-The classification of farms by tenure of operatur was based on data reported for Iand owned, land rented from others or worked for others on shares, Iand managed for others, and land rented to others or worked on shares ly others. The same basis of classification was used in 1959 as in 1954.

For 1959, each duestiomatre was coded, during the editing process, to indicate whether it represented a farm operated by a full owner, part owner, manager, or tenant. The sample questionnaires for tenants were given a code to indicate the kind of tenant.

The various classifications of tenure, as used for the $10: 9$ census, are defined below:
a. Full 0 wners "perate only land they own.

1. Part Owners onerate land they own and also land rented from others.
c. Managers operate land for others and are paid a wage or salary for their services. lersons acting merels as caretakers or hired as laborers are not classitied as managers. If a farm operator managed land for others and also operated land on his own account, the land operated on his own account was considered as one farm and the land managed for others as a second firm. If, however, he managed land for two or more employers, all the managed land was considered to be one farm.
d. Tenants rent from others or work on shares for others all the land they operate. They are further classified, as described below, on the basis of rental arrangements in regard to the payment of cash rent, sharing of crops, sharing of livestock or livestock products, and the furnlshing of work power by the landlord.
(1) Cash Tenants pay cash rent, either on a per-acre basls or for the farm as a whole.
(2) Share-Cash Tenants pay part of the rent in eash and part in a share of the crops and/or of the livestock and livestock products.
(3) Crop-Share Tenants pay a share of the crops but not of the livestock or llvestock products.
(4) Livestock-Share Tenants pay a share of the livestock or livestock products. They may or may not also pay a share of the crops.
(5) Croppers are tenants whose landlords furnished all the work animals or tractor power. They usually work under the close supervision of the landowners or their agents, or other farm operators. Also, the land assigned to them is often merely a part of a multi-unit operation. Croppers may or mas not also pay cash rent or a share of crops, livestock, or livestock products. Data for croppers are avallable for only 16 southern States and Missouri.
(6) Other Tenants are those who did not qualify for inclusion in any of the foregoing subclassifications. They may have had the nse of land rent-free or in return for a fixed quantlty of products, payment of taxes, maintenance of bulldings, etc.
(i) Unspecified Tenants are those for whom the rental arrangement was not reported.
The definition of each subclass of tenant was essentially the same for earlier censuses as for 1959. In 1945, however, the enumerator was asked to determine the subclass of tenants whereas in other censuses all classifications were made during the processing of questionnaires on the basis of the data reported. The procedure used in 1945 may have affected the comparability of the data, especially for cash tenants and share-cash tenants.
Farms by Economlc Class. -The totals for farms ly cenomic class are estimates for all farms made on the basis of data reported only for the sample farms. The economic classlfications represent groupings of farms that are similar in characteristics and size of operation. The economic classes were established on the basis of one or more of four factors: (1) total value of all farm products sold, (2) number of days the farm operator worked off the firm, (3) the age of the farm operator, and (4) the relatlonship of income received by the operator and members of bis household from nonfirm sources to the value of all farm products sold. Instltutional farms, Indian reservations, agricultural experiment stations, and grazing associations were alway's classified as "abnormal."

The total value of farm products sold was obtained by additlon of the reported or estimated values for all products sold from the farm. The value of cattle and calves, horses and mules, dairy products, some poultry products, vegetables, nursery and greenhouse products, standing timber, and miscellaneous forest products was obtained from the farm operator during the enumeration. The quantity sold was obtained during enumeration for corn, sorghums, small grains, hay, small fruits, some of the forest products, chickens and chicken eggs, hogs, sheep, and goats. To obtain the value of sales of these products, the quantity sold was multiplled by State average prices.

For each of the other products, the entire production was multiplied by the State average price. If the resulting value amounted to $\$ 100$ or more, the entire quantity produced was considered as sold. This procedure was followed only in establishing the economic class and the type of farm but was not used in establishing the total value of products sold from the farm. (See p. XXV.)

Farms were grouped into two major categories, commerclal farms and other farms, mainly on the hasis of total value of products sold. The 1959 class intervals and some of the criteria for determination of a given class are different from those used in 1454 and in 1950 . In general, for 1959 , all farms with a ralue of sales amounting to $\$ 2,500$ or more were classiffed as commercial. Farms with a value of sales of $\$ 50$ to $\$ 2,499$ were classified as commercial if the farm operator was under 65 years of age and (1) he did not work off the farm 100 or more days during the year and (2) the income received by the operator and members of his family from nonfarm sources was less than the value of all farm products sold. The remaining farms with a value of sales of $\$ 50$ to $\$ 2,499$ and institutional farms and Indian reservations were included in one of the groups of "other farms."

Commercial farms were divided into six economic classes on the basis of the total value of all farm products sold, as follows :

| Class of Farm | Value of Farm |  |  |
| :---: | :---: | :---: | :---: |
|  | Prod | ucts | sold |
|  | \$40,000 |  | over |
| II | \$20,000 | to | \$39,999 |
| III | \$10,000 | to | \$19,999 |
| IV | \$5,000 | to | \$9,999 |
| V | \$2,500 | to | \$4,999 |
| VI* | \$50 | to | \$2,499 |

Provided the farm operator was under 65 years of age, and-
(1) he did not work off the farm 100 or more days, and (2) the in come that he and members of his household recelved from noafarm somerces was iess than the total value of farm products sold.

Other farms were divided into three economic classes as follows:
a. Class VII, Part-time-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classlfied as "part-time" If the operator was under 65 years of age and he either worked off the farm 100 or more days or the income he and members of his housebold received from nonfarm sources was greater than the total value of farm products sold.
b. Class VIII, Part-retirement.-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classified as "partretirement" If the farm operator was 65 years old or over. Many of these are farms on which the income from nonfarm sources was greater than the value of sales of agricultural products. Others are residential, subsistence, or marginal farms. In previous censuses, the age of the farm operator was not a criterion for grouping farms by economic class. Since the number of elderly people in our population has been steadlly increasing during recent sears, a separate classification for farms operated on a part-retirement basls was considered important for an adequate analysis of the agricultural structure of a county or State.
c. Class IX, Abnormal.-All institutional farms and Indian reservations were classified as "abnormal," regardless of the value of sales. Institutional farms include those operated
by hospitals, penitentiaries, schools, grazing assoclations, government agencies, etc.
Farms by Type.-The data for farms by type are estimates bused on data tabulated for the farms in the sample. The type represents a description of the major source of income from farm sales. To be classified as a particular type, a farm had to have sales of a particular product or group of products amounting in value to 50 percent or more of the total value of all farm products sold during the year.

The types of farms, together with the products on which type classification is based, are as follows:

| Type of Farm | Source of Cash Income |
| :---: | :---: |
|  | (Products with sales value representing $50 \%$ or more of total value of all farm products sold) |
| Cash-grain | Corn, sorghoms, small gralns, soybeans for beans, cowpeas for peas, dry field and seed beans and peas. |
| Tobacco | Tobacco. |
| Cotton | Cotton. |
| Other field-crop | Peanuts, potatoes (Irish and sweet), sugarcane for sugar or sirup, sweet sorghums for sirup, broomcorn, popcorn, sugar beets, mint, hops, and sugar beet seed. |
| Vegetable | Vegetables. |
| Fruit-and-nut | Berries, other small fruits, tree fruits, grapes, and nuts. |
| Poultry | Chickens, chicken eggs, turkeys, and other poultry products. |
| Dairy | Milk and cream. The criterion of 50 percent of total sales was modified in the case of clalry farms. A farm having value of sales of dairy products amounting to less than 50 percent of the total value of farm products sold was classified as a dairy farm, if- |
|  | (a) Milk and cream sold accounted for more than 30 percent of the total value of products sold aud- <br> (b) Milk cows represented 50 percent or more of total cows and- |
|  | (c) The value of milk and cream sold phus the value of cattle and calves sold amounted to 50 percent or more of the total value of all farm products sold. |

Livestock other than
dalry and poultry--..... Cattle, calves, lings, sheep, goats, wool and mohair except for farms in the 17 Western States, Loulsiana, and Florida that qualified as livestock ranches.
Llvestock Ranches_-.-. Farms in the 17 Western States, Loulslana, and Florida were classified as livestock ranches if the sales of livestock, wool, and mohair represented 50 percent or more of the total value of farm products sold and if pastureland or grazing land amounted to 100 or more acres and was 10 or more times the acreage of cropland harvested.
General_-_------...... Field seed crops, hay, silage. A farm was classificd as general also if it had cash income from three or more sources and did not mect the criteria for any other type.
Miscellaneous Nursery and greenhouse products, forest products, mules, horses, colts and ponies. Also all institutional farms and Indian reservations.

The type classifieations were essentially the same for the $\mathbf{1 9 0} 9$ as for the 1954 census except that tohace farms and livestock ranches were not semarately classified in 1954. Tobaceo was included as one of the rops used in the classification of "other feld crop" farms in 19.54. The farms classified as livestock ranches in 1959 would have been classified as "livestock other than dairy and poultry" in 19.4 without regard to the acreage in pasture.

Value of Farm Products Sold. - Hata for the value of farm produets sold in 1959 were obtained by enumeration for some produets and by estimation for others. The questionnaire used for the 1959 census provided for farm operators to remort value of sates for the following products:

Vegetables
Nursery and greenhouse prod-

## ucts

Miscellaneous poultry products Stand
Miscellaneous forest produets Milk and cream
Cattle
Calves
Horses, mules, colts, and ponies
For all other agricultural products, the value of sales was estimated during the office processing. The State arerage prices used for calculating the value of farm products sold were furnished to the Bureau by the Agricultural Marketing Service of the U.S. Department of Agriculture. One of three following procedures was used.
(1) For the mroducts for which data on quantities sold were obtained during emmeration, the State average prices were multiplied by the comnty totals of the quantities reported as sold or the quantities reported as produced for sale. The following products were covered lyy this procedure :

## Corn for grain

Sorghums for grain, seed, sirup, or dry forage
All small grains
Hay crops
All berries and small fruits ${ }^{1}$
Firewood and fuelwood
Pulpwood
Fence posts
Sawlogs and reneer logs
Christmas trees
Chickens (broilers and others)
Chicken eggs
Hogs and pigs
Sheep and lambs
Goats and kids
${ }^{1}$ Adjustment made for cranberries based on Cranberry Payment Program.
(2) For most of the agrieultural products which are customarily raised for sale, the entire quantity produced was considered to be sold. The State average prices were, accordingly, multiplied by the county total of production. The following crops were covered hy this procedure:

Cotton Sugareane for sugar
Popeorn
ngarcane for sugar
Sugar leets for sugar
Wool
Mohair
(3) For all other crops, the state arerage prices were multiplied by the quantities sold as estimated on the hasis of cropdisjusition data furnished by the Agrieultural Marketing service, data reported in questions for "other erops" on the 1959 questionnaire, or data ohtained from earlier censuses.

For all tree fruits, nuts, and grapes, the entire quantity produced was considered as suld, except for apples, apricuts, sour aud sweet cherries, peaches, llums, prunes, avoeados, tangerines, oranires, and grapefruit in states where a portion of the crop was not harrested or was suljected to excess cullage as indieaterl by data obtained from the Agricultural Marketing Serviee of the U.S. Department of Agriculture.

The data for 1959 are comparable with those for 1954 since essentially the same procedures were used in both censuses for estimating quantities and values of farm products sold. In 19.9. as in 1954 , data for the sales of farm products represent total sales for the entire farm, regardless of who shared the receipts. For tenant-operated farms, the landiord's share of agricultural products was considered as sold provided the products were moved off the tenant farm. All erops, livestock, and poultry raised under a contract arrangement were considered as sold from the farm where they were raised. For institutioual farms. all agricultural items produced on land operated by the institution and consmaed by the inmates were to be reported as sold.

All sales data relate to one year's farm operations. Crop sales are for crops harvested during the crop year, whether the crops were actually sold immediately after harvest or placed in storage for later sale. Sales of livestock and livestock products relate to the ealendar sear, regardless of when the livestoek or products were raised or produced. All wool and mohair reported as shorn or clipped was cousidered as sold.

Enumerators were instructed to record gross values of quantities sold, with no deductions fol feed, seed, fertilizer, water, jabor, or marketing eosts. For some products, however, net ralues may have been reported. In the case of milk, particularly, some farm ojerators may have reported the payments they received as the gross value of sales, eren though the burer had deducted handling and hauling charges before making payment. Adjustments were made in the data reported only in cases of obvious error.

## Chapter A

## STATISTICS FOR THE STATE

State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued

Part 2 of 8.-Cotton farms

Z Reported in small fractions
${ }^{1}$ Includes milk equivalent of cream and butterfat sold.
${ }^{2}$ Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farns with less than 20 trees and grapevines.

Part 3 of 8.-Other field-crop farms

## PREFACE

Volume I, Counties, is one of the five principal reports presenting the results of the 1959 Census of Agriculture. This volume, in 54 parts, presents the compilation of the information given by farm operators to census enumerators in 1959.

The 1959 Census of Agriculture was taken in conformity with the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13, United States Code.

The collection of the data was carried out by census enumerators directed by supervisors appointed by the Director of the Bureau of the Census and working under the direction of Robert B. Voight, then Chief, Field Division. Paul R. Squires, then Special Assistant to the Director, was responsible for the recruitment of the field staff. The planning of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Division, Warder B. Jenkins, Assistant Chief, and Orvin L. Wilhite, Assistant Chief. They were assisted by M. Vincent Lindquist, Thomas Jabine, Robert S. McCauley, John C. Mackey, Robert Standley, Hilton E. Robison, Helen E. Teir, Carl R. Nyman, Kenneth R. Norell, Gladys L. Eagle, Henry L. DeGraff, Charles H. Boehne, Joseph A. Correll, Margaret G. Wood, Evelyn K. Jett, Simon Yablon, Emma B. Gass, Charlotte J. Messinese, Bennie L. Sharp, Isaac E. Lemon, James M. Lindsey, Samuel S. Murray, William F. Kauffman, Hector Vila, Harry P. Owings, Charles A. Nicholls, Henry A. Tucker, Robert S. Boyle, Helen M. Davenport, Albert W. Graybill, Lois G. Miller, Thomas D. Monroe, Gerald P. Owens, Bernard L. Ross, Marvin M. Thompson, Helen D. Turner, Kurt W. Luethy, Arnold L. Bollenbacher, George W. Coffman, Joseph A. Horak, Samuel J. Hundley, Donald K. Larson, Chester G. Lykins, Wilmer R. Maxham, Virgil L. McClain, Jr., Darrell D. Prochaska, Robert J. Rades, Hubert E. Sites, Duane E. Traylor, Donald H. von Steen, Elmer O. Rea, Frances G. Compton, Lillian W. Bentel, and Neil V. Perkins.

Acknowledgment is made of the technical assistance and the loan of personnel by the United States Department of Agriculture in the planning, the enumeration, and the compilation of the 1959 Census of Agriculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1959 <br> FINAL REPORTS

Volume I-Counties-A separate part for each State. Statistics on number of farms; farm characteristics; acreage in farms; cropland and other uses of land; land-use practices; irrigation; farm facilities and equipment; farm labor; farm expenditures; use of commercial fertilizer; number and kind of livestock; acres and production of crops; value of farm products; characteristics of commercial farms, farms classified by tenure, by size, type, and economic class; and comparative data from the 1954 Census of Agriculture.

Volume I is published in $\mathbf{5 4}$ parts as follows:

Volume II—General Report.-Statistics by Subjects, United States Census of Agriculture, 1959. Summary data and analyses of the data by States, for geographic divisions, and for the United States, by subjects, as illustrated by the chapter titles listed below:

| Chapter | Title | Chapter | Title |
| :---: | :---: | :---: | :---: |
| I | Farms and Land in Farms. | VII | Field Crops and Vegetables. |
| II | Age, Residence, Years on Farm, Work Off Farm. | VIII | Fruits and Nuts, Horticultural Specialties, Forest Prod- |
| 1 II | Farm Facilities, Farm Equipment. |  | ucts. |
| IV | Farm Labor, Use of Fertilizer, Farm Expenditures, and Cash Rent. | IX | Value of Farm Products. Color, Race, and Tenure of Farm Operator. |
| V | Size of Farm. | XI | Economic Class of Farm. |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |

Volume III-Irrigation of Agricultural Lands. Western States (Dry Areas)-Data by States for drainage basins and a summary for the area, including number and types of irrigation organizations, source of water, expenditures for works and equipment since 1950, water used and acres served for irrigation purposes.

Volume IV-Drainage of Agricultural Lands. Data by States on land in drainage organizations, number and types of organizations, cost of drainage and drainage works.

Volume V-Special Reports, Part 1.-Hortlcultural Specialties. Statistics by States and a summary for the United States presenting number and kinds of operations; gross receipts and/or gross sales; sales of nursery products, flower seed, vegetables grown under glass, and propagated mushrooms; number of containergrown plants; inventory products; sales of bulb crops; employment; structures and equipment.

Titles of additional parts of this volume are not available as this report goes to press.

## INTRODUCTION

## THE 1959 CENSUS OF AGRICULTURE

History of the Census.-The 1959 Census is the 17 th nationwide agricultural census. The first agricultural census was taken in 1840, at the same time as the Sixth Decennial Census of Population. From 1850 to 1920 , an agricultural census was taken every 10 gears. With increased application of scientific fiudings and the growing use of mechanization in agriculture, farming practices were changing so rapidly that facts collected at 10 -year intervals were no longer adequate. Aware of the need for more accurate and timely information, the Congress in 1909 (36 stat. 10 , sec. 31 , provided for a census to be taken in 1915 and every 10 Jears thereafter which was to be in addition to the census of agriculture to be taken at the time of the decennial census of population. The 1915 census was not taken, however, because of the abnormal conditions created by World War I. Beginning with 1920, a national agricultural census has been taken every 5 years.

Legal Basis for the Census.-The 1959 Census of Agriculture was authorized by an Act of Congress, as were all prior censuses of agriculture. "Title 13, United States Code-Census," codified in August 1954, and amended in August 1967 and September 1960, is now the legal basis for censuses of agriculture and other censuses, and survers conducted by the Bureau of the Census. Section 142, paragraph (a), of Title 13 makes provision for the Census of Agriculture. It reads as follows:

#### Abstract

"The Secretary shall, beginning in the month of October 1959, and in the same month of every fifth year thereafter, take a census of agriculture, provided that the censuses directed to be taken in October 1959 and each tenth year thereafter, may, when and where deemed advisable by the Secretary, be taken instead in conjunction with the censuses provided in section 141 of this title." (Section 141 relates to the decennial censuses of population, unemployment, and housing to be taken as of the first day of Amil of each decennial year.) Under authority granted by Section 4 of Title 13 , the Secretary of Commerce delegated "the functions and duties imposed upon him by this title" to the Director of the Bureau of the Census.

Pretest of the 1959 Census.-A "pretest" of the field procedures of the 1959 Census of Agriculture was conducted in 17 counties of the United States during the fall of 1958 . The purpose of the pretest was to provide the Bureau with a measure of the effectiveness of the questions and procedures planned for the 1959 nationwide census. Three versions of the agriculture question-naire-the first one for Northern States, the second for Southern States, and the third for Western States-were used in the pretest. Each version contained questions appropriate to the type of agriculture in the part of the country where it was used. All major aspects of field forms and procedures, from the hiring and training of crew leaders and enumerators to actual interviews with farm operators, were given a "trial run" in each of the 17 counties. Preliminary versions of reporting forms, maps, payroll records, training guides, and instruction manuals were subjected to actual use under conditions simulating those expected in the nationwide enumeration conducted in the fall of 1959.

In making final preparations for the 1059 census, the staff of the Burean drew beavily on the results of the pretest, as well as on experience gained from previous censuses.

Training Program for Personnel for Enumeration.-Every persou bired to do work in connection with the 1959 Census of Agriculture received specialized training for his job. Staff mem-
bers of the Washington and Reglonal Offices of the Bureau and of the U.S. Department of Agriculture trained approximately 110 agriculture field assistants and 2,100 crew leaders. The crew leaders, in turn, trained and sppervised approximately 30,000 enumerators. All training was presented according to procedures contained in various guides and manuals prepared by the Bureau. The training program included filmstrips, map-reading, practice interviewing, and practice flling of questionnaires and other census forms. In most instances, training sessions were held near the areas in which employees worked and immediately prior to the beginning of their assignments.

Enumeration Perlod.-The actual enumeration in the conterminous United States (see page XIV) started at dates varying from October 7 to November 18, 1959. In general, starting dates were based upon regional variations in harvesting seasous and on weather conditions. The primary aim was to have the enumeration late enough to follow the harvesting of the lulk of important crops and early enough to precede the advent of winter weather with the attending unfavorable travel conditions. The bulk of the enumeration work was completed within three to four weeks after the starting date. In Hawaii, the enumeration was made during the months of Decensber 1959 and January 1960 ; and in Alaska, during April 1960.

Enumeration starting dates for the censuses of 1959 and 1954 are given in State table 11, together with figures showing the percentage of farms enumerated in the State during weekly periods. The average enumeration date for the 1959 census for each county is given in county table 6 .

Data for inventory items-land in farms, machinery and equipment, livestock, and poultry-relate to the situation at the actual time of enumeration of each individual farm. Data for acres, production, and sales of crops relate generally to the crops barrested during the crop year 1959 , regardless of whether and wheu they were sold while data for sales of livestock and livestock products relate to the calendar sear 1959. Since the enumeration was made before the end of 1959 , special emphasis was placed upon the inclusion of estimates for crops yet to be sold and for livestock and livestock products expected to be sold in the period from the time of enumeration to the end of the calendar year. Instructions on the questionnaire and the wording of questions were designed to assure that full cron-Fear or calendar-year data would be reported. For example, "How much of this year's crop was or will be sold?"

## ENUMERATION FORMS AND PROCEDURES

Authorization.-Section 5 of Title 13 of the United States Code authorizes the preparation of forms and questionnaires used in the census. It reads as follows:
"The Secretary shall prepare schedules, and shall determine the inquiries, and the number, form, and subdivisions thereof, for the statistics, surveys, and censuses provided for in this title."
The Agriculture Questionnalre.-The questionnaire for the 1959 Census of Agriculture was prepared by the staff of the Bureall. Selection of the inquiries was based on the results of the 19.8 pretest and experience gained in earlier censuses. Careful consideration was given to such factors as the current availability
of data from other sources, the possibility of obtaining data by methods other than a census, the adequacy of the data that might be obtained, and the need for and usefulness of the data. Two committees gave advice and counsel to the Bureau. One of these, a Special Advisory Committee, was composed of members designated by the organizations they represented, following an invitation from the Director of the Bureau of the Census to name a representative to serve in an advisory capacity. The Special Advisory Committee for the 1959 Census of Agriculture was made up of one representative from each of the following: Agricultural Publishers Association, American Association of LandGrant Colleges and State Universities, American Farm Bureau Federation, American Farm Economic Association, American Statistical Association, Farm Equipment Institute, Nationai Association of Commissioners, Secretaries, and Directors of Agriculture, National Council of Farmer Cooperatives, Nationai Farmers' Union, National Grange, Rural Sociological Society, and the U.S. Department of Agriculture. A representative of the Bureau of the Budget was in attendance at ail meetings of the Advisory Committee.

Because of the special interest of the U.S. Department of Agriculture in censuses of agriculture, the Director of the Bureau of the Census sought the continuous cooperation of that organization in developing plans, questionnaires, and procedures for the 1959 Census of Agriculture. Working Groups were established in the U.S. Department of Agriculture to make recommendations for the following general subjects:

Tenure, Land Values, and Mortgage Debt<br>Land Use and Conservation and Production Practices<br>Field Crops<br>Fruits and Vegetables<br>Forest Products<br>Livestock, Poultry, and Dairy<br>Income and Expenditure (including Contractual Operations) Farm Labor<br>Equipment aud Faciiities (including Structures)

Each Working Group had the responsibility for ascertaining the U.S. Department of Agriculture's need for data in the field covered by its "terms of reference" and for presenting recommendations to a small Joint Committee comprising representatives of both the Burean of the Census and the U.S. Department of Agricuiture. The Joint Committee received written recommendations from each Working Group. The Chairman of each Group appeared before the Joint Committee as did any member of the Working Group who was needed to present supplemental information of a specialized nature.

Prior to the formulation of the questionnaire, State Agriculturai Colleges and other major users of census data were invited to suggest inquirles for the enumeration. Each member of the Special Advisory Committee had the opportunity and the responsibllity for channeling in suggestions from the organization be represented. The number of inquiries submitted from ali sources greatiy exceeded the number that could be included in the census, from the point of riew of cost, of the respondent's tlme and patience, and of practical value to the majority of users of data.

The final selection included 316 questions, some of which consisted of several parts, for the 48 States comprising the conterminous United States. Aithough each of the 316 questions was asked in one or more of the 48 States, considerably less than this total was asked in any one State because of the use of "State" questionnaires. Moreover, about 50 questions out of the total were asked of approximately one-fifth of all farm operators in the State. The number of questions ranged from 159 on the questionnaire for Maine to 194 on the questlonnaire for California. In ail, 38 versions of the questionnaire-one for each State or combination of adjoining States and two for Texas-
were used for the 1959 census in the conterminous United States as compared with 21 versions in 1954 and 41 in 1950 . A separate version was used in Alaska and another in Hawaii.

Differences in the questionnaires were designed to account for regionai and iocal differences in agriculture. Most, but not all, of the differences related to crops. The use of State questionnaires made possible the inciusion of separate inquiries for ail important crops grown within a State and, at the same time, a reduction in the total number of inquiries for a State. Questions that did not apply, to any considerabie degree, to a particular State were omitted from the questionnaire used in that State. For example, separate questions about citrus fruits were omitted from all questionnaires except for the few States where citrus fruits are grown. An added advantage of State questionnaires was that production and sales data could be asked in the unit of measure most commonly used by the farmers in each State. Regional variation in the number and type of questions is an important provision of the census for obtaining complete corerage of agricultural operations.

About 2 weeks before the start of the enumeration, agriculture questionnaires were malled to most househoids in rural areas. A letter was attached to each questionnaire asking the farm operator to fill the questionnaire and to give it to the enumerator when be called. The purpose of this procedure was to save time and money in taking the census and to improve the quaity of the information given by farm operators. By having the questionnaire ahead of time, the farmer could determine what information would be required and could check his records in adivance of the enumerator's visit. It was, however, the responsibility of the enumerator to obtain an agriculture questionnaire for each place which qualified. If the questionnaire bad been filled out by the farm operator, the enumerator was instructed to examine the questionnaire for completeness and accuracy and, if need be, to give the farmer such heip as might be necessary.

Agricultural Operations.-The training of enumerators stressed the concept that a census of agriculture is a census of agricultural operations rather than a census of farms. This concept was intended to assure a complete agricultural census free of any personal judgment by enumerators as to what constitutes a farm. In accordance with clearly defined procedures, an enumerator was required to obtain an agriculture questionnaire for each person who had charge of one or more agricultural operations, whether or not he considered himseif to be a farm operator. For enumeration purposes, it was considered that there were agricuitural operations on a place if, at any time in 1959
a. Any livestock (hogs, cattle, sheep, goats, horses, or mules) were kept on the place.
b. A combined totai of 20 or more chickens, turkeys, and ducks were kept on the place.
c. Any grain, hay, tobacco, or other fleld crops were grown on the piace.
d. A combined totai of 20 or more fruit trees, grapevines, and nut trees were on the piace.
e. Any vegetables, berries, or nursery or greenhouse products were grown on the piace for sale.
As a result of the requirement that all places having agricultural operations be enumerated, more questionnaires were obtained than are included in the tabuiations for farms. During the office processing operations that followed the completion of enumeration, criteria were applied to the questionnaires to sort out for tabulation those that represented farms according to the census definition of a farm (see page XIV).

Enumeration Assignments and Enumeration Districts.-To assure a complete enumeration within the time alioted, the United States (excluding Alaska and Hawaii) was divided into 29,374 Enumeration Assignments, or EA's. Each EA comprised an
area that one enumerator could reasonably be expected to canvass within a 3 - to 4 -week period, as indicated by performance records from the 1954 census.

Each EA was made up of one or more Enumeration Districts, or "ED's," as the geographic unit for enumeration. Prlor to the enumeration, the ED's were ciassified into three groups on the basis of the density of dwellings in relation to the number of farms, as indicated by the 1954 Census of Agriculture, the 1950 Census of Population and Housing, current population estimates, and highway mans showing culture which were basic to establishing the boundaries of each asslgnment. Through the use of different canvassing procedures for each group of ED's, the Bureau was able to reduce the cost of enumeration without running any material risk of missing any farms or other places with agricultural operations. The ED groupings and canvassing procedures are described below.

Group I Enumeration Districts.-In general, ED's with no well-defined cluster of dwellings were considered to be opencountry areas and comprise Group I. For each ED of Group I, in his Enumeration Assignment, the enumerator was required to list in his Record Book the name of every head of household living in the ED and also the name of every person not llving In the ED who had agricultural operations there. There were approximately $20,7.51$ ED's in Group I for the 1959 Census.
Group II Enumeration Districts.-Rural ED's in which the number of dwellings was large in relation to the number of farms were considered to be in Group II. For each ED, in Group II, the enumerator was required to list the head of the household for all dwellings in the ED except for those on less than one acre of ground in built-up residential areas of 50 or more dwellings. He was also required to determine, by observation or local inquiry, whether there were any farms or other places with agricultural operations in the built-up areas and, if so, to obtain nn agriculture questionnaire. There were approximately 7,979 ED's in Group II.

Group III Enumeration Districts.-Most incorporated places and unincorporated villages having approximately 150 or more dwellings were designated as separate ED's and are classified as Group III. Also, most ED's in counties around large metropolitan areas were designated as Group III Ed's. Prior to the 1959 Census of Agriculture, places enumerated in these areas during the 1954 Census of Agriculture were listed in the Enumerator's Record Book. The enumerator was required to visit and enumerate or otherwise account for each place listed in his Record Book. In addition, he was instructed to ask at each of these places if there were any farms or other places with agricultural operations in the Enumeration District, and, if so, to add them to his list and enumerate them. There were approximately 15,836 Group III ED's in 1959 . According to the 1954 Census, these ED's contained 380,575 farms.
A few enumeration districts that comprised incorporated places or that were within an incorporated city were classified as Group I or Group II because they had a large number of farms. A few others, comprising extensive rural districts requiring considerable travel, were classified as Group III because they had only a small number of farms.

Enumerator's Record Book.-Each enumerator received one or more Record Books containing a listing form for use during canrassing. (See appendix for facsimile of one page of listing form included in Enumerator's Record Book.) The lines on the listing form were numbered in consecutive order. Except as otherwise prescribed for Group II and Group III ED's, the enumerator listed in bis Record Book the name of each head of househoid living in his assigned area and also the name of each person not living in his area who had agricultural operations there. As he made his listing, he also asked the questions about agricultural operations that were printed on the listing form. Answers to these questions determined, for the enumerator, whether or not an agriculture questionnaire was required for the person listed and, if so, whether he or some other enumerator was responsible for gettling it. Thus, the Record Book served as an important aid to the enumerator in securing complete corerage of all agricultural operations within his area. At the same
time, it helped to prevent enumeratlon of the same piace by two or more enumerators.

Enumeration Maps.-As a second ald to getting complete coverage, each enumerator received a map or, in a few exceptional cases, a brief written description of the area assigned to him for enumeration. He was required to plan and follow an orderly ronte of enumeration within the boundaries of his assigned area in accordance with established canvassing procedures. As the enumerator listed a place in hls Record Book, be indicated its location by copying onto his map the number of the line on which he listed it. This numbering system indicated the enumerator's route of travel, and helped both the enumerator and bls crew leader to determine the extent of coverage of the enumerator's assignment at any given time.

Lists of Special and Large Farms.-Prior to the enumeration, a card list of "special and large farms" was prepared on the basis of records obtained from the 1954 census and from Federal and State agricultural agencies. In general, "speciai and large farms" fell into one of three categorles: (1) farms having unusually large acreages, livestock inventories, or annual sales as iudicated by available records; (2) farms known to be specializing In such operations as broiler production, turkey growlng, feed lots, nursery or greenhouse production, cranberry bogs, citrus groves, etc.; (3) farms that might easily be overlooked because they had absentee operators or were not locally thought of as farms, such as institutions, Indian reservations, grazing associations, etc.

Enumerators were given the cards for the special and large farms within their assigument areas to use as aids to obtaining complete coverage. Generally, the cards provided insurance against the omission of farming units that could have a significant effect on the totals for a given county or State. The enumerator was instructed to obtain an agriculture questionnaire for each special or large farm in hls area or to write an explanation on the card as to why an agriculture questionnaire was not required on the basis of 1959 operatlons. The crew leader had a duplicate set of cards for use in checking enumeration coverage.

Landlord-Tenant Questionnaire.-As in several previous censuses, a special landlord-tenant questlonaire was used in some parts of the South as a supplement to the agriculture questionnaire. Its purpose was to help the enumerator get complete and accurate coverage of individually operated tracts of land that were actually part of one operating unit under the control of one landlord. To accomplish this purpose, the enumerator was required to fill a landlord-tenant questionnaire for each landlord who had any land worked on shares. The entries made in this questionnaire included the name of each sharecropper, tenant, or renter; the amount of land asslgned to each; and the acreage and quantlty of crops harvested on shares. By checking these entries agalnst the agriculture questionnaires obtained for the individual operators, the enumerator and the Central Office could verify that each part of the operating unit controlled by the landlord was enumerated and that it was enumerated only once. The landlordtenant questionnaire was used in 386 counties in the 1959 census as compared with approxlmately 900 counties in 1954.

Township Sketch Map.-In some areas of the Great Plains, a considerable portion of land is farmed by nonresident operatorsthat is, by persons who do not live on the land they operate or who llve on it only during part of the year. Enumerators in these areas used a special mapping form, the Township Sketch, in additlon to their enumeration maps as an ald to obtaining complete coverage. Each township included on the sketch was identified by township and range number and was dlvided into 144 small squares. In a standard section of 640 acres, each square represented a quarter section of land, or 160 acres. As the enumerator canvassed his assignment area, be indicated the acreage and location of each farm, ranch, and tract of nonfarm
land by drawing its boundaries on the sketch. He also used a simple numbering system as a cross reference between the agricultural land identified on the sketch and the questionnaire on which it was reported. The Township Sketch was used in all counties of North Dakota and South Dakota and in selected counties of Colorado, Kansas, Minnesota, Montana, Nebraska, New Mexico, Oklahoma, and Wyoming.

Field Review of Enumerator's Work.-In the 1959 census, greater emphasis was placed on a detailed review of enumerators' work during enumeration than had been the case in previous censuses. The objective was to detect and correct enumeration errors as early as possible in order to achieve and maintain a high quality of individual performance. Starting on the first day of enumeration and continuing throughout the enumeration period, each crew leader was instructed to make regular and frequent visits to his enumerators. At each visit, he was to follow a clearly defined procedure for observing the enumerator's conduct of interviews and for checking his listings, maps, questlonnalres, and other forms for accuracy and completeness.

As an aid to checking coverage and enumerator efficiency, the crew leader was given a list containing estimates, based on the 1954 census, of the number of questionnaires requlred in each enumeration assignment area within his district, and of the mileage and time required to obtain those questlonnaires.

## SAMPLING

Use of Sampling.-In the 1959 census, as in several previous censuses, sampling was used in two ways: for enumeration and for tabulation. Sampling in enumeration consisted of the collection of information about the items included in sectlons IX through XV of the questionnaire for only a sample of farms. The "sample" items relate to sales of dairy products and sales of Hestock, nse of fertilizer and lime, farm expendltures, land-use practices, farm labor, equipment and facilities, rental agreements, farm values, and farm mortgage debt. The same sample of farms was used for tabulations by type of farm and by economic class of farm and for many of those by slze of farm and by color and tenure of operator.

Description of the Sample.-The sample used for the 1959 Census of Agriculture conslsted of all farms with a total area of 1,000 or more acres or with estimated sales of $\$ 100,000$ or more in 1950 , and approximately 20 percent of all other farms. Farms with 1,000 or more acres were universally lncluded in the sample during enumeration. As the enumerator filled the questionnaire, he determined the number of "acres in this place" (see question 7 of the agriculture questionnaire). If the acreage amounted to 1,000 or more he was required to fill sections IX through XV of the questionnalre. Farms with less than 1,000 acres, with estlmated sales of $\$ 100,000$ or more, were included in the sample during the offce processing. For these farms the information for sections IX through XV was obtained by mail.

The selection of farms of less than 1,000 acres for inclusion in the sample was made during enumeration, accordlng to the following procedure: As the enumerator determined that he was required to obtain a questionnaire, he assigned a number to it, whether or not he was able to obtaln the questionnaire on his first vlsit. He assigned numbers in consecutive order, beginning with " 1 " for the first questionnaire required $\ln$ each enumeration district withln his area. He was instructed to fill sections IX through XV on all questionnalres for which the assigned number ended in " 2 " or " 7 " (i.e. $2,7,12,17,22$, etc.).
Adjnstment of the Sample.-An adjustment in the part of the sample that was comprised of farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$ was made by a process essentialiy equivalent to stratifying the farms in the sample by
size of farm. The purpose of thls adjustment was to improve the reliability of the estimates based on the sample and to reduce the effects of possible blases introduced by enumerators who deFiated from the prescribed procedure for selecting the sample farms. The adjustment procedure was carried out for "blocks" of counties, each consisting of from one to ten countles in a State. To adjust the sample, separate counts were made for each county, and for the block of counties of all farms and of farms in the sample for each of 10 size-of-farm groups based on the "acrea in thls place" (question 7). The 10 size-of-farm groups were as follows: under 10 acres, 10 to 49 acres, 50 to 69 acres, 70 to 99 acres, 100 to 139 acres, 140 to 179 acres, 180 to 219 acres, 220 to 259 acres, 260 to 499 acres, and 500 to 999 acres. Farms of less than 1,000 acres, but with value of sales of $\$ 100,000$ or more, were excluded from these counts. For each size-of-farm group, the number of farms in the sample for the block of counties was adjusted to make it equal or approximately equal to the total number of farms divlded by five. This was accomplished for each group by the elimination or duplication on a random basia, of farms in those counties where the difference between the actual proportion in the sample and the expected 20 percent was in the same direction as the difference for the block of counties.
Estimation of Totals for the Sample.-For the items included In the sample part of the questionnaire (sections IX through XV), estimated totals for all farms were derived from the tabulated totals for the farms in the adjusted sample. First, item-byItem totals, as tabulated for that part of the sample comprising farms of less than 1,000 acres and with estimated sales of less than $\$ 100,000$, were multiplied by 5 . These estimated tem-byitem totals were then added to the corresponding Item totals, as tabulated, for all farms of 1,000 acres and over and farms with estimated sales of $\$ 100,000$ and orer. The resulting values represent the estimated totals for all farms.
Presentation of Sample Data.-In tables where a small amount of data based on the sample farms is presented together with data for all farms, the data based on the sample are printed in italics. Other tables contaln headnotes explaining that most of the data are estlmates based on reports for only a sample of farms.

Reliability of Estimates.-The estlmated totals for all farms of the items enumerated for only the sample farms are subject to sampling errora. The estimated totals obtained by making tabulations for only the farms included in the sample are also subject to sampling errors. State tables 23 and 24 contain approximate measures of the sampling reliablity of the eatimates for numbers of farms reporting and for Item totals. While these measures ladicate the general level of sampling rellability of the estimates, they do not completely reflect errors arising from sources other than sampling; for example, errors in the orlginal data reported by farmers. Errors arising from sources other than sampling may, in some instances, be relatively more important than sampling variation, eapecially for county totals.

The general level of aampling rellabillty of estimated totala may be determined from the data in State tables 23 and 24 . State table 24 contains a list of items, together with a figure for each Item fadicating one of the four levels of aampling rellability that are presented in State table 23 . For each item the aampling error according to the number of farms reporting may be determined from State table 23, in the column for the level of sampling reliability designated in State table 24 . To determine the sampling reliabllity for any item, reference must be made to State table 24 to find out which of the four levels of sampling reliability given in State table 23 should be used, and also the appropriate county or State table to obtain the number of farms reporting the item.

As explained in State table 23, the level of sampling reliability designated as level 1 should always be used to determine the sampling rellability of estimated numbers of farms or of farms reporting.

State table 23 shows percentage limits such that chances are about 68 out of 100 that the difference between an estimate based on the sample and the figure that would hare been obtalned from a tabulation of all farms would be no more than the percentage specified for the estimated number of farms reporting that item. The chances are about 99 out of 100 that the difference would be less than $21 / 2$ times the percentage specified.

As indicated by the percentages in State table 23, the smaller the number of farms reporting a given ltem, the larger the relative sampling error in the estimated total for that item. Even so, considerable detail is presented for each item, by several classificatlons of farms, in order to permit the appraisal of estimates for rarious combinations of items not shown in this report. Percentages and averages that may be derived from the tables will generally have greater relative reliability than the corresponding estimated totals. However, significant patterns of relationships may be observed in the estimated totals even though the individual data are subject to relatively large sampling errors.

The data representing estimates based on a sample of farms for the 1954 census were obtained in essentially the same way as in 1959. Therefore, State tables 23 and 24 may also be used to determine the sampling errors for the 1954 data.

Differences in Data Resulting From Differences in Tabulating Procedures.-Many of the figures in the detailed State tables represent estimates obtained by tabulating only the sample farms. The totals for these detailed distributions will generally differ somewhat from totals presented in other tables obtained from different distributions which were tabulated on a 100 percent basis. Moreover, although most of the figures presented by counties were obtalned from tabulations of all farms, the data in county table 4 for commercial farms, and all of the data in the county tables on dairy products and livestock sold, fertilizer and lime, farm expenditures, land-use practices, farm labor, facilities and equipment, and value of land and buildings were estimated for each county on the basis of data tabulated for the farms in the sample. The State totals in the country tables for these items, though based also on the sample, were obtained in a different series of tabulating runs, and so mas differ stightly from totals presented in some State tables. For reasons of economy the sample distributions were not adjusted to the $\mathbf{1 0 0}$ percent totals even when such totals were available, nor were slight discrepancies resulting from different runs of the sample data alwass reconciled untess the differences were large enough to affect the usefulness or reliability of the data.

## PROCESSING OPERATIONS

Completion of Enumeration.-As an enumerator completed his assignment, be turned the portfolio containing questionnaires and other census materials orer to his crew leader. After making a final review of the enumerator's work, the crew leader mailed the portfolio to the Agriculture Processing Office at Parsons, Kansas. There, each enumerator portfolio was thoroughly checked for completeness of all required forms and for correct application of the sampling procedure.

Editing of Questionnaires.-Each agriculture questionnaire was individually edited and coded before the information was transferred to punch cards and tabulated. As the first major step in the editing process, questionnaires that did not represent farms according to the census definition were withdrawn from fur-
ther processing. (See p. XIV.) As the second major step, the remaining questionnalres were examined for errors, omissions, and inconsistencies. Among the speciffc items subjected to consistency checks were the following:
a. Total acreage compared with its distribution by use.
b. Acreage of individual crops harvested compared with total cropland harvested.
c. Irrigated acreage compared with total acres in the farm.
d. Total acreage of individual crops for all purposes compared with the acreage harvested for specific purposes.
e. Quantity of crops harvested in relation to acreage harvested.
f. Sales in relation to production and, for livestock, to inventories.
g. Total livestock compared with the inventory by age and sex.
h. Expenditures compared with production and inventories.

Obvious errors in calculations or in units of measure, and misplaced entries were corrected as they were found. Entries not clearly legible were rewritten. Many omissions or inconsistencies were dlsregarded during editing. Those of significant magnitude could be and were handled more efficiently and economically during mechanical processing operations. Qnestionnaires containing major inconsistencies and omissions were referred to members of the technical staff for review. Depending on the magnitude of the data involved, the technical staff corrected (or supervised the correction of) the questionnaires either on the basis of information reported for other farms of similar type in the area or on the basis of additional information received in response to letters directed to the farm operaturs.

Coding of Questionnaires.-Most of the numerical information on a questionnaire was self-coding in that the inquiry number was utilized for the item identification on punch carls or on tabulations runs. However, some manual coding was also necessary for such items as irrigated crops for selected states, crops infrequently reported, miscellaneous poultry, etc. Code numbers were entered on questionnaires to classify farms and, in some cases, to identify data for individual items. All farms were coded by size of farm in terms of total acreage, by race, and by tenure of operator. Farms in the 17 Western States, Louisiana, and Hawaii were also coded on the basis of irrigated cropland and irrigated pasture. Additional codes were applied to all farms included in the sample to classify them by type of farm and by total value of agricultural products sold. Indivilual items were coded only where reports were received for crops or poultry not covered by separate inquiries on the questionnaire. This coding was necessary to assure inclusion of the data in the appropriate farm product totals.

Tabulation of Data.-After the questionnaires were edited and coded, the Information on them was punched on cards. The cards were then mechanically sorted and fed into machines whlch transferred the data to tabulation sheets. One of the initial and primary steps in the machine handling of the punch cards was to separate and list those cards which lacked necessary information, those which contaiued inconsistent or impossible data, and those on which the data were possible but of such magnitude that a further review of the individual questionnaires was warranted. The listing sheets were examined and, as necessary, the cards were corrected. When the cards for a particular county were considered satisfactory, the data were tabulated.

Subject-matter specialists of the Bureau and the U.S. Department of Agriculture examined all tabulations for reasonableness and consistency. As necessary, they made corrections on the basis of a further review and reappraisal of the original reports and verification of the editing, coding, aud punching.

## PRESENTATION OF STATISTICS

Statistical Content of This Report.-This report is part of Volume I of the 1959 Census of Agriculture. Volume I consists of 54 parts, each part containing information about agriculture for a single State, Comnonwealth, or Possession. Each part contains county data for that particular state or area. The term "county," as used in this report embraces election districts in Alaska, parishes in Louisiana, municipios (municipalitles) in Puerto Rico, etc. The statistics for 1959 were obtained from the Census of Agriculture taken in the "conterminous United States" (see following paragraph). Hawaii, and Puerto Rico during the period October 1959 to January 1960 and in Alaska, American Samoa, Guam, and Virgin Islands as of April 1, 1960. Comparative data for years prior to 1959 were obtained from earlier censuses.

In the planning of the publications for the 1960 Censuses of Population and Housing and the 1959 Census of Agriculture, the term "conterminous Unlted States," recommended by the Board of Geographic Names to designate the 48 -State area as it existed before Alaska and Hawaii became States, was adopted by the Bureau of the Census.

The definitions and explanations in thls introduction for volume I generally have application broad enough to include the States of Alaska and Hawaii, and the Commonwealth of Puerto Rico and the island possessions. However, specific application in many instances may be limited to the conterminous United States; for example, references to earlier censuses, to the sampling methods and procedures, to specific sections or questions on the questionnaires, and to specific table numbers.

For each part of volume I (one part for each State or area), a facsimile of the appropriate questionnaire is reproduced in the appendix.

The statistics for States and counties are presented according to the same general plan as was followed in the volume I reports for the 1954 and the 1950 censuses. State and county totals are given for nearly all items for which information was obtained ln the 1959 census. However, most of the data by economic class of farm, type of farm, and color and tenure of farm operator are given only for States.

Comparative data for the States are given for each census year beginning with 1920. Comparative data for counties are given for the years 1959 and 1954. For some items, the data obtained from the 1959 census are the only ones available. For comparative purposes 1950 data are carried in county table 6 for the kind of road on which farms were located.

Comparability of Data.-The data obtained from the various censuses of agrlculture are not strictly comparable for all ltems. For example, differences from one census to another in the tlme of enumeration, the wording of the questions, and the definition of a farm cause some lack of comparability. Differences considered to have a significant effect on the comparability of data are descrlbed in the text and/or mentioned in footnotes to the tables.

Minor Civil Divisions.-As in prior censuses, data for most of the items included in the 1959 Census of Agriculture were tabulated for minor civil divisions. The term "minor civil divislon" applies to the primary subdivision of a county into smaller geographic areas such as townships, precincts, districts, wards, beats, municipalities, etc. Figures for these smailer geographlc areas are not included in any of the published reports, but they may be supplied upon request and payment of the costs of compiling and checking the data.

Prior to the 1954 Census, an enumeration assignment did not include more than one minor civil division, even in cases where the township, precinct, etc., did not have enough farms to provide a full workload for an enumerator. In 1954, and again in 1959,
the aim was to make enumeration assignments large enough to keep each enumerator fully occupied in his area for a 3 - to 4 -week period. Hence, in some areas, two or more adjoining minor civil divisions were combined into one enumeration assignment. An enumeration assignment never comprised the whole of one minor civil division and a part of another, nor a part of two or more minor civil divisions. A minor civil division that included too many farms for one enumerator to cover during the enumeration period was divided into two or more enumeration assignments.

In some cases, the minor civil division tabulations provide totals for a single minor civil division, even when such totals required a grouping of enumeration assignments. In other cases, the minor civil division tabulations provide totals for a combination of two or more adjoining minor civil divisions. The data for each individual minor civil division included in such totals can be tabulated separately, however, since each questionnalre obtained in the census contains the designation of the minor civil division in which the farm headquarters was located. An additional charge must he made for a separate tabulation of any small area included In a total for two or more combined minor civil divisions.

Requests for census information for minor civil divisions should be directed to the Agriculture Division, Bureau of the Census, Washlngton 25, D.C.

## DEFINITIONS AND EXPLANATIONS

Descriptlve Summary and References.-The definitions and explanations that follow relate only to those items that are considered to be inadequately described in the tables where they appear. Although the descriptive terms and explanations refer specifically to the 1959 Census of Agriculture, many of them also apply to earlier censuses. Nost of the definitions consist of a résumé of the questionnaire wording, supplemented by excerpts from instructions given to enumerators. For exact wording of the questions and of the instructions included on the questionnalre, see the facsimile of the 1959 Agriculture Questionnaire in the appendix of this report.

An analysls of the questions asked $\ln$ the 1959 census, and of the data obtalned, is given in Volume 11, General Report, Statlstics by Subjects, United States Census of Agrlculture, 1959. The general report presents statistics for States by subject matter.

## General Farm Information

Census Deflnition of a Farm.-For the 1959 Census of Agriculture, the definition of a farm was based primarily on a combination of "acres in the place" and the estimated value of agricuitural products sold.

The word "place" was defined to include all land on which agricultural operations were conducted at any time in 1959 under the control or supervision of one person or partnership. (For definition of "agricultural operations", see p. X.) Control may have been exercised through ownership or management, or through a lease, rental, or cropping arrangement.

Places of less than 10 acres $\ln 1959$ were counted as farms if the estimated sales of agricultural products for the year amounted to at least $\$ 250$. Places of 10 or more acres in 1059 were counted as farms if the estimated sales of agricultural products for the year amounted to at least $\$ 50$. Places having less than the $\$ 50$ or $\$ 250$ minimum estimated sales ln 1959 were also counted as farms if they could normally be expected to produce agriculturai products in sufficlent quantly to meet the requirements of the definition. Thls additional qualification resulted ln the inclusion as farms of some places engaged in farming operations for the first time in 1959 and places affected by crop failure or other unusual conditions.

To avoid biases arising from an enumerator's personal judgment and opinion, the Bureau dld not give enumerators the defini-
tion of a farm. Instead, enumerators were instructed to obtain questlonnaires for all places consldered farms by their operators and for all other places that had one or more agricultural operations. (See "Agricultural Operatlons", p. X.) In 1954, enumerators were lnstructed to fill questionnalres on the same basis as in 1959 . In 1950, agricultural operations were defined to include every place of 3 or more acres, whether or not the operator considered it a farm, and every place having "specialized operations", regardless of the acreage. "Specialized operatlons" referred to nurseries and greenhouses and to places having 100 or more poultry, production of 300 or more dozen eggs in 1949, or 3 or more hives of bees. In all of the three last censuses, as a result, questionnaires were filled for a considerable number of places that did not qualify as farms. The determination as to which questionnaires represented farms was made during office processing operations and only those questionnaires meeting the criteria for a farm were included in the tabulations.

For both the 1950 and 1954 Censuses of Agriculture, places of 3 or more acres were counted as farms if the annual value of agricultural products, whether for home use or for sale but exclusive of home-garden products, amounted to $\$ 150$ or more. Places of less than 3 acres were counted as farms only if the annual sales of agricultural products amounted to $\$ 150$ or more. A few places with very low agricultural production because of unusual clrcumstances, such as crop failure, were also counted as farms if they normally could have been expected to meet the minimum value or sales criteria.

In the censuses from 1925 to 1945 , enumerators were given a definition of "farm" and were instructed to obtain reports only for those places which met the criteria. According to this definition, farms included all places of 3 or more acres, regardless of the quantity or value of agricultural production, and places of less than 3 acres if the value of agricultural products, whether for home use or for sale, amounted to $\$ 250$ or more. Because of changes in price level, the $\$ 250$ minimum resulted in the inclusion of varylng numbers of farms of less than $3^{\circ}$ acres in the several censuses taken during this period. Generally, the only reports excluded from tabulation were those taken in error and those showing very limited agricultural production, such as only a small home garden, a few fruit trees, a small flock of chickens, etc. In 1945, reports for places of 3 acres or more were tabulated only if at least 3 acres were in cropland and/or pasture or if the value of products in 1944 amounted to at least $\$ 150$.

The decrease in the number of farms in 1950 and 1954, as compared with earlier censuses, was partly due to the change in farm definition, especially with respect to farms of 3 or more acres in size. Some of the places of 3 or more acres that were not counted as farms in 1950 and 1954 because the ralue of their agricultural production was less than $\$ 150$ would have qualified as farms if the criteria had been the same as in earlier censuses.
For 1959, the decrease in the number of farms as compared with all prior censuses resulted partly from the change in farm definitlon. The fact that sales of agricultural products in 1959 was used resulted in the exclusion of some places that would have quallfied as farms had the value of agricultural products alone been considered. The increase $\ln$ the acreage minimum also had an effect. The reduction $\ln$ the number of farms due to change in definition, 1954 to 1959 , is shown for each county in county table 1. Some characteristics of the places not counted as farms In 1959, but which would have been included in 1954, are shown in State table 10.

The change in farm defnition made in 1950 and again in 1959 had no appreciable effect on the totals for livestock or crops because the places affected by the change ordinarily accounted for less than 1 percent of the totals for a given county or State.
For the States that comprise the conterminous United States, two figures are published for each county on the number of farms
in 1959. One is an actual count of all farms and the other is an estimate based on the number of farms included in the sample. For almost every county there is a difference between the actual number of farms and the estimated number of farms. Because of sampling procedure and sampling variability, the number of farms in the sample seldom agrees exactly with the actual number of farms. For most counties, the actual number of farms In the sample was either more or less than precisely 20 percent of all farms. Similarly, totals estimated on the basis of data for the sample farms may be sllghtly more or slightly less than the actual totals that would have been obtained had the data been tabulated for all farms. Therefore, the estimated number of farms reporting certain items may, in some instances, be greater than the total number of farms shown in county table 1. However, the estimated number of farms is given in county tables 5 and 6 so that estimates based on the sample farms may be related to the estimated rather than the actual number of farms.

Farm Operator.-The term "farm operator" is used to designate a person who operates a farm, either doing the work himself or directly supervising the work. He may be the owner, a member of the owner's household, a hired manager, or a tenant, renter, or sharecropper. If he rents land to others or has land worked on shares by others, he is considered as operator only of the land which he retains for his own operation. In the case of a partnership, only one partner is counted as an operator. The number of farm operators is considered to be the same as the number of farms.

Farms Reporting or Operators Reporting.-Figures for farms reporting or operators reporting, based on a tabulation of all farms, represent the number of farms, or operators, for which the specified item was reported. For example, if there were 1,922 farms in a county and only 1,465 had chickens 4 months old and over on hand at the time of enumeration, the number of farms reporting chickens would be shown as 1,465 . The difference between the total number of farms and the number of farms reporting a partlcular item represents the number of farms not having that item, provided a correct report was received for all farms.

Where applicable, figures may be given for the number of farms or operators not reporting items that were intended to be obtained for all farms; for example, residence of farm operator, State table 4. The number not reporting, as compared with the total nomber of farms or operators, indicates the extent of incompleteness of the reporting of the data for the item.

Land Area.-The approximate total land area of States and counties as reported for 1959 is, in general, the same as that reported for all censuses beginuing with 1940. Such differences as are shown reffect political changes in boundaries or actual changes in land area caused by changes in the number or size of reservoirs, lakes, streams, etc. For Alaska, the areas for election districts represent the gross area of land and water.

Land in Farms.-Except for managed farms, the land to be included in each farm was determined from the answers to questions about the number of acres owned, the number of acres rented from others or worked on shares for others, and the number of acres rented to others or worked on shares by others. The acres owned and the acres rented from others or worked on shares for others were first added together and then the acres rented to others or worked on shares by others were subtracted. The result represented the number of acres in the farm. The number of acres in a managed farm was the difference between the total land managed and that part of the managed land that was rented to others or worked on shares by others.

In the 1959,1954 , and 1950 censuses, enumerators were instructed to record total figures for land owned, land rented from others, and land managed for others, including any part of the land that was rented to others. In censuses prior to 1950, enu-
merators were instructed to exclude all land rented to others and to record only that portion of the nereage owned, rented from others, or managed for others that was retained by the farm operator. Thus, the figures for the individual temures of land are not entirely comparable for all censuses. However, the land $\ln$ cluded in each farm was determined on essentially the same basis for all censuses.

The acreage deslgnated in the tables as "land in farms" consists primarlly of "agricultural" land-that is, land used for crops and pasture or grazing. It also includes considerable areas of land not actually under cultiration nor used for pasture or grazlng. For example, the entire acreage of woodland and wasteland owned or rented by farm operators is included as land in farms, unless it was being held for nonagricultural purposes or unless the acreage was unusually large. For 1959 and 1954, if a place had 1,000 or more acres of woodland not pastured and wasteland, and if less than 10 percent of the total acreage in the place was used for agricultural purposes, the acreage of woodland not pastured and wasteland was reduced to equal the acreage used for agriculture. The procedure used in 1950 for excluding unusually large acreages of woodland not pastured and wasteland differed slightly from the one used in 1959 and 1054. In 1950. adjustments were made in places of 1,000 or more acres ( 5,000 or more in the 17 Western States), if less than 10 percent of the total acreage was used for agrlcultural purposes.

Except for open range and grazing land used under government permit, all grazing land was to be included as land in farms provided the place of which it was a part was a farm. Grazing land operated by Grazing Associations was to be reported in the name of the person chieffy responsible for conducting the business of the Association. Land used rent free was to be reported as land rented from others. All land in Indian reservations that was used for growing crons or grazing livestock was to be lncluded. Land in Indian reservations that was not reported by individual Indians and that was not rented to non-Indians was to be reported in the name of the cooperatire group that nsed the land. In some instances, an entle Indian reserration was reported as one farm.

Land owned.-All land that the operator and/or his wife held under title, purchase contract, homestead law, or as heir or trustee of an undivided estate at the time of enumeration is considered as owned.

Land Rented from Others.-This item includes not only land that the operator rented or leased from others but also land he worked on sbares for others and land he oceupied rent free. Grazing land used under government permit or license is not included.

Land Rented to Others.- This ltem includes all land rented or leased to others, except land leased to the government under the Soil Bank, and all land worked by others on shares or on a rent-free basis. For the most part, the land rented to others represents agricultural land but $1 t$ also Includes land rented for residential or other purposes. The tenant or sharecropper is considered as the operator of land leased, rented, or worked on shares even thongh his landlord may supervise his operations. The landlord is considered as operator of only that portion of the land not assigned to tenants or croppers.

Land Managed,-Thls item includes all tracts of land man. aged for one or more employers by a person hired on a salary basls. A hired manager was considered to be the operator of the land he managed since he was responsible for the agrlcultural operations on that land and frequently supervised others In performing those operations. Managed land was always to be reported on a separate questionnaire whether or not the manager also operated a farm on his own account.

Land in Two or More Counties.-An individual farm was nlways enumerated in only one county, even in cases where the land was located in two or more counties. If the farm operator lived on the farm, the farm was enumerated in the county where he lived. If he did not live on the farm, the figures for the form were tabulated for the county where the farm headquarters was located. In cases where there was any question as to the location of the headquarters, fizures for the farm were tabulated for the county where most of the land was located.

Land in Farms According to Use.-Land in farms has been distributed according to the way in which it was used in 1959. The land uses described in the followiag paragraphs are mutually excluslve; that is, each acre of land is included only once even though it may lave had more than one use durlng the jear.

Cropland Harvested.-This category refers to all land from which any crops were harvested in 1959 , whether for home use or for sale. It includes land from which hay (including wild hay) was cut and land in berries and other small fruits, orchards, vineyards, nurseries, and greenhouses. Matured crops hogged off or grazed were considered to have been "crops harvested" and were reported here. Land from which two or more crops were haryested in 1959 was to be counted only once in the land-use classification, Land used for other purposes either before or after the crops were harvested was to be reported as cropland harvested, without regard to the other uses.

The enumerator was instructed to check the figure for cropland harvested for each farm by adding the acreages of the individual crops and subtracting the acreages from which two or more crops were harvested. This checking procedure was repeated during the office processing of questionnaires for all farms having 100 or more acres of cropland harvested.

Cropland used only for Pasture.-This land-use classification includes rotation pasture and all other land used only for pasture or grazing that the operator considered could have been used for crops without additional improrement. Enumerators were instructed to include land planted to crops that were hogged off. pastured, or grazed before maturity but to exclude land bastured before or after hay or other crops were harvested from it. Permanent open pasture may have been reported either for this item or for "other pasture" depending on whether or not the operator considered it as cropland.

The figures for 1945 and earlier censuses are not entirely comparable with those for the last three censuses. For 1945, the figures include only cropland used solely for pasture in $\mathbf{1 9 4 4}$ that had been plowed within the preceding seven sears. The figures for 1940,1985 , and 1925 are more nearly comparable with those for 1959,1954 , and 1950 , however, because they in. clude land pastured that could have been plowed and used for crops without additional clearing, draining, or irrigating.

Cropland not Harvested and not Pastured.-This classification represents a total of three subclasses for the 17 Western States and two subclasses for other States.

Cultivated Summer Fallow.-This subclass of land is shown only for the 17 Western States. It refers to cropland that was plowed and cultivated but left unseeded for the 1959 harvest in order to control weeds and conserve moisture.

Soil Improvement Grasses and Legumes.-Fur the 1959 census, land used unly for corer crops to control erosion or to he plowed under for green manure is tabutated separately from "other eralimal". After the establislment of the Soil Bank, land that wonld mormally have heen used for other purpuses was frequently planted to soil-improvement crops. In counties where large arreages were placed in the Soil Bank, the total of land used for soil-improvement crops phus "other cropland" may be considerably larger than the "other cropland" shown for previous censuses.

Other Cropland.-This subclass includes idle cropland, land in crops intended for harvest after 1959 , and cropland not harvested because of complete crop failure, low prices, labor shortage, or other reasons. The 1929 figures for "other cropland" are not entirels comparable with those for previous censuses since they do not include land used only for soil-improrement crops. (See preceding paragraph.)
Woodland Pastured.-This classification includes all woodland where livestock were pastured or grazed in 1959. The instruction on the questionnaire "Inclucle as woodland all wood lots and timber tracts; cutover and deforested land which has value for wool products and has not been improved for pasture"-represents a somewhat more precise deflnition than the corresponding instruction contained on the 1054 questionnaire. No definition of woodland was given in 1950 apart from an instruction to enumerators not to include brush pas. ture as woodland. Some of the changes in woodland acreages from one census to another mas merely represent differences in interpretation as to what constitutes "woodland."

Woodland not Pastured. Whis classification refers to all Woodland not used for pasture or grazing in 1959, including land in operated farms that was placed in the Soil Bank and planted to trees. Unusually large tracts of timberland that were reported as woodland not pastured were excluded from
the tabulation of land in farms when it was evident that such land was held primarily for nonagricultural purposes.

Other Pasture.-This classification refers to all land other than woodland and cropland that was used only for pasture or grazing in 1959. It includes noncrop open or brush pasture and cutover or deforested land that has been improved and used for pasture. The figures for the last three censuses are comparable but those for 1945 include all nonwoodland pasture that had not been plowed during the preceding seven years. For the 1940 census and earlier years, the figures are more nearly comparable with those for the last three censuses. Howerer, the classification may be somewhat less inclusive because land that could have been plowed and used for crops without additional clearing, draining, or irrigating was classified as plowable pasture and included with "cropland used only for pasture".

Improved Pasture.-This subclass refers to that portion of "other pasture" on which one or more of the following practices lad been used: liming, fertilizing, seeding, irrigating, draining, or the clearing of weed or brush growth. The figures are comparable with those for 1954, when the question on improved pasture was asked for the first time.
Other Land.-This classification refers to all land not included in the preceding land-use classifications, such as house lots, barn lots, lanes, roads, ditches, land area of ponds, and wasteland. This figure for 1959 was obtained from the machine tabulations by subtracting the total of all other uses from the total land in all farms reported for a given county or classification. Hence, there is no figure given to represent the farms reporting this item.
Value of Land and Buildings.-Only average values of land and buildings per farm and per acre are presented in this report. They are estimates based on data obtained for sample farms. Estimates of the total ralue of land and buildings by States, geographic divisions, and the United States, are presented in volume II.
The enumerator was instructed to record the market value of the land and the buildings on that land. Market value was defined as the price which the farm operator would expect to receive for the laud and buildings if he were to sell them on the day of enumeration.

More problems and difficulties arise in the enumeration of farm-real-estate values than in the enumeration of most other agricultural items. Most of the items enumerated require the respondent to make a statement of fact. For example, information about the number and value of farm animals sold alive during the year is based on actual transactions. Similarly, information about livestock inventories relates to the situation existing on a specific place at a specific time. Reports concerning the value of land and buildings, howerer, are estimates based almost entirely on opinion. The majority of farms have not changed hands for many fears and are not currently for sale. For such farms, the operators are not likely to have any clear basis for estimating the value. To make an intelligent and objective estimate, a respondent first needs to make an estimate of the prevailing average market value of farms in his community. Then, he must either add to or subtract from that estimate to allow for the different characteristics of his own farm. In many cases, an operator who would not sell his farm under any circumstances may report an unreasonably high market value. In other cases, a farm operator who acquired his real estate during a period of relatively low prices may estimate an unrealistically low value by current standards. Because of the extent of variation that is known to exist in real estate values, it is difficult to devise checking procedures that will identify inaccurate estimates.

Age of Operator.-Farm operators were classified by age into six age groups. The average age of farm operators was derived from the sum of the ages of all farm operators reporting age dirided by the number reporting. The number of farm operators 65 or more years of age is an actual count based on the operators reporting age.

Residence of Operator.-Farm operators were classified by residence according to whether or not they llved on the farms they were operating. Some of those who did not live on the farms they operated themselves lived on farms operated by others. In cases where all the land was rented from others or worked on shares for others, the operator was considered to live on the farm operated provided the dwelling he occupied was included in the rental agreement. The dwelling, ln such cascs, was not necessarily on the land being operated. Similarly, a farm operator who did not live on the land being cultivated or grazed but who had some agricultural operations (other than a home garden) at his dwelling was considered as living on the farm operated.

Since some farm operators live on their farms only during a part of the year, comparability of the figures for various censuses may be affected by the date of enumeration.
In a few cases, the enumerator failed to report the residence of the farm operator. Differences between the total number of farms and the number of farm operators classified by residence indicate the extent of under-reporting.

Year Began Operating Present Farm.-Enumerators were instructed to report the year during which a farm operator began to operate his present farm and, if the year was 1958 or later, also to report the month. The year was intended to refer to the first year of the period during which the operator had been in continuous charge of his present farm or of any part of it. The time of year that farmers move is indicated by the month they began operating their farms, as shown by a monthly breakdown of the reports for farmers who begau operating their present farms during 1958 and 1959.

Off-Farm Work and Other Income.-To obtain a measure of the extent to which farm operators rely on nonfarm sources for part of their income, four questions were asked of all farm operators. The first question asked for the number of days the operator worked off bis farm in 1959. The other three questions, to be answered "Yes" or "No," asked (1) whether other members of the operator's household did any work off the farm; (2) whether any income was received from sources other than the sale of agricultural products from the farm operated; and (3) whether the combined income of all members of the housebold from off-farm work and other sources was greater than the total value of agricultural products sold from the farm operated.

Off-farm work was defined to include work on someone else's farm for pas as well as all types of nonfarm jobs, businesscs, and professions, whether the work was done on the farm premises or elsewhere. Exchange mork was not included.

The questions asked in the 1959 Census are closels comparable with those asked in 1954 . The data for 1959 are actual totals of all operators reporting off-farm work and other income whereas those for 1954 are estimated totals based on the sample.

Equipment and Facilities.-In 1959 as in several earlier censuses, data about specified equipment and facilities were obtained for only a sample of farus. Farm operators were asked to report equipment and facilities that were on the farm at the time of enumeration, regardless of ownership. They were to include items that were temporarily out of order but not any that were worn out.

Data in terms of actual number were oltained for the following items of farm culuipment in 1059: (1) grain combines, (2) cern pickers, (3) pick-up balers, (4) field forage harvesters, (5) 1notortrucks, (6) wheel tractors, (7) garden tractors, (8) crawler tractors, and (9) antomohiles. Definitions given enmerators included the following specifications, among others: Corn pickers related to all types of nachines used for picking corn, whether used in separate or in combined picking-sheling perations. Pick-up balers were to include both hand-tie and automatic balers but not stationary ones. Motortrucks were to include pick-up trucks and truck-trailer combinations; jeeps and station wagons
were also to be included if they were used primarily as trucks, but school buses were specifically excluded. Wheel tractors specifically excluded garden tractors, implements with built-in power units, such as self-propelled combines or powered buck rakes, and the power unit of a truck-trailer combination. Automobiles were to include jeeps and station wagons li they were used primarily as passenger cars.

Questions to be answered "Yes" or "No" provided information as to the presence or absence of the following items: (1) telephone, (2) home freezer, (3) milking machine, (4) electric milk cooler, (5) bulk-type milk cooler (ln six States only-Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin), (6) crop drier and (7) power-operated elevator, convejor, or blower.

Comparable data from one census to another are not available for all items. The questions asked about equipment during a glven census reflect changes in farm mechanization and in the facllities available to farm famllies. Questions about some items of equipment were asked In 1959 for the first time (electric milk cooler, crop drier, bulk-type milk cooler, etc.). Similarly, some questions that were asked in earller censuses were omitted in 1959. For example, the use of electrlcity is now so widespread that there is no longer any need for obtaining a count of the farms having it.

Farms by Kind of Road.-The classificatlon of farms by the kind of road on which they are located is based on only a sample of farms. The enumerator was instructed to report, on the basis of hls own observation, the kind of road on which the most frequently used entrance to the farm was located. For farms consisting of two or more tracts, he was to limit his report to the tract on which the farm operator had his dwelling or other headquarters.

Farm Labor.-The questlons about farm labor were asked only for the sample farms and related to persons working during the calendar week preceding the week of enumeration. Since the enumeration starting dates varied by geographic areas, and the enumeration within each area lasted over a period of several weeks, the calendar weeks to which the data apply also vary. Thus, the data for an individual farm may relate to any one week during the months of October, November, or December, or even, in a few lnstances, to weeks during September 1959 or January 1960.

Farm labor was defined to include any work, chores, or planning necessary to the agricultural operations of the farm; and to exclude housework, contract construction work, custom machine work, and repair, installation, or construction work done by persons employed specifically for such work. The farm labor lnformatiou contained in thls report represents estimates based on answers to questions relating to the farm work or chores done during the week by (1) operator, (2) unpald members of the operator's famlly, and (3) hired persons. An operator was considered as working if be worked one or more hours; unpaid members of the operator's famlly, if they worked 15 or more hours; and hired persons, if they worked at all during the week.

Data are not fully comparable from one census to another, primarlly because of differences in the period to which they relate. In 1954 , the data were purposely related to elther one of two calendar weeks, depending ln part on the starting date set for the enumeration and ln part on whlch week represented a period of peak employment wlthin a given State. For the majorlty of States, the period specified was the week of September 26-October 2 ; for other States, the week of October 24-30.

In 1950 , as $\ln 1959$, the data related to the week preceding the actual enumeration. Unlike 1959, however, enumeration starting dates were ldentlcal for all States in 1950 (April 1) but since several weeks were required to complete the enumeration, the calendar week precedlng the enumeration was not ldentical for
all farms. In 1945 and 1935, the number of farm workers related to the first week in January and, in 1940, to the last week in March. In 1945,1940 , and 1935 , only persons working the equivalent of two or more days during the specified week were to be included. In 1945 and 1940, an additional specification limited the workers to those 14 years old and over.

Experience gained from earlier censuses indicates that farm labor data are often unsatisfactorily reported unless the week speclfied is the week immediately preceding the actual enumeration. When a farm operator was asked to report the number of persons employed during a specified week that was several weeks prior to enumeration, be often reported the highest number of persons employed during the year. Obviously lncorrect reports were adjusted to make the data reflect more nearly the situation known to exist during the specified week. The farm labor data for 1954 relates to a specified week which, in some cases, was several weeks prior to enumeration. Few adjustments were made in those data, however, even though there were indications of incorrect reportling.

Hegular and Seasonal Workers.-Hired persons working on the farm during the week concerned were classed as "regular" workers if the period of actual or expected employment was 150 dass or more during the year. They were classed as "seasonal" workers if the period of actual or expected employment was less than 150 days. In cases where the period of employment was not reported for an individual farm, it was estimated from data for such items as basis of payment, wage rates, expenditures for labor in 1959 , and type of farming operations.

Hired Workers by Basls of Payment.-Hired persons were also classified according to whether they were paid on a monthly, weekly, daily, or hourly basis, or by piecework. In cases of incomplete reporting, the basis of payment for hired workers was supplied during the office processing operations.

Wage Rates and Hours Worked.-The agreed cash rate of pay was asked for each class of hired worker except those employed on a piecerork basis. (The number and the earnings of persons paid on a piecework basis were required for those who worked on Friday of the week preceding the enumeration.) The number of hours that workers were expected to work to earn their pay was asked for each class except those employed on an hourly or piecework basis. For 1959 and 1954, the data include office estimates for farms submitting incomplete reports of wage rates and hours worked. The estimates were consistent with the size and type of operations for the individual farm as compared with similar farms in the area for which complete reports were received. The corresponding data for 1950 apply only to farms that reported both wage rates and hours worked.
Fertllizer and Lime.-The questions about fertilizer and lime, asked only for the sample farms, relate to the acreage on which fertilizer and lime were used and to the quantity used. Farm operators were asked to report total quantities used in 1959 on the farms they operated regardiess of when or by whom the fertilizer and lime were purchased. In the South, some landlords who operated farms themselves included the fertilizer and lime they had purchased for use on their tenant-operated land. Such fertilizer and lime may also have been reported by the tenants. When double reporting was detected during the editing process, the data on the questionnaires concerned were adjusted to elimlnate duplication in the totals.

The 1959 data for fertilizer and lime are entirely comparable with those for 1954. A breakdown between dry and liquid fertilizing materials was not obtained $\ln 1954$ and data on cost of either fertilizer or lime were not obtained in 1959.

Fertilizer.-The report for fertilizer was to refer only to commercial fertillzer and fertllizing materials, including rock phosphate. The acres fertilized and the tons of fertilizer applied to those acres were obtained separately for selected crops. The selected crops varied by region so that it was posslble to obtain detailed data for the crops most commonly fertllized in each region. In cases where the same land was used for more than one crop, the acres fertilized were to be reported separately for each crop. If the same crop was fertilized more than once, however, the acres in that crop were to be reported only once. In all cases, the total quantity of fer-
tilizer used in 1959 was to be reported, inciuding quantities used on land occupied by crops planted in 1958 or by crops to be harvested in 1960.
Reports for quantity of fertilizer and fertilizing materials used were required for both dry and hiquid materials. The terms "dry" and "iiquid" referred to the form in which the fertiiizers and fertilizing materials were purchased and not to the way in which they were appiied. Thus, dry fertilizers were those purcbased in dry or solid form, as powders, dusts, granuies, peliets, etc.; iiquid fertilizers were those purchased in fuid form, as solutions or as liquefled gases.

Lime.-The data for ime relate to the total acreage limed in 1959 and the totai tonnage of lime and iiming materiais used on those acres for purposes of conditioning the soli. Instructions on the questionnaire stated that ground limestone, hydrated and burnt lime, marl, and oyster shells were to be inciuded but that lime used for spraying or sanitation purposes was to be omitted.

For some counties, the tonnage of iime shown in the table may be less than the tonnage reported for the Agricuiture Conservation Program or the Conservation Reserve Program of the Soii Bank. Differences may be due either to sampling error or to under-reporting by farm operators. Many of the differences are minimized or eliminated entirely in the data presented on a State or regional basis.
Specified Farm Expenditures.-The data for farm expenditures are estimates based on reports obtained from the sample farms. The 1959 questionnaire contained questions for six items of farm expenditure: (1) purchase of feed for livestock and poultry, (2) purchase of livestock and pouitry, (3) machine hire, (4) hired iabor, (5) seeds, bulbs, plants, and trees, and (6) gasoiine and other petroleum fuel and oil. With the exception of items (2) and (5), exactly the same questions were asked in 1954. For each item specifled, the total expenditures made for the farm in 1959 were to be reported, whether made by the farm operator, his iandiord, or both. A farm operator who rented part of his land to others was to report only the expenditures for the land be operated himself. Enumerators were instructed to ask respondents who bad difficulty estimating their expenses for the period between enumeration and the end of the year to estimate them on the basis of current costs.

Feed.-The report on feed purcbased for livestock and poultry was to include expenditures for grain, hay, millfeeds, pasture, sait, condiments, concentrates, and mineral suppiements as weif as for the grinding and mixing of feed. The estimated cost of items furnished by a landiord, contractor, or otber owner for feeding pouttry and livestock kept on the farm was also to be included. Payments made by a tenant to his landlord for feed grown on the tenant farm were to be excluded.

Livestock and Poaltry.-The cost of baby chicks and turkey poults was to be included in the expenditures made for the purchase of livestock and pouitry. Enumerators were instructed to ask the farm operator to include the cost or estimated purchase vaiue of poultry and ivestock provided by others and cared for by the operator under a contract feeding arrangement. The cost of livestock purchased for resale within 30 days was not to be included. A short-term transaction of that nature was considered to be a dealer operation, not an agricultural one.

Data on the purchase of livestock and poultry were not obtained in 1954. The instructions for the 1950 census specified that expenditures for domestic rabbits, fur-bearing animais kept in captivity, and bees were to be inciuded. Any lack of comparability in the 1950 and 1959 data resuiting from inclusion or exclusion of rabbits, fur-bearing animals, or bees is considered to be so slight as to be insignificant.

Machine Hire.-Expenditures for macbine hire relate to custom machine work, such as tractor hire, threshing, grain or seed combining, silo filling, baling, cotton picking, cotton ginning, corn picking, plowing, vegetable harvesting, fruit picking, spraying, and dusting. Any amount spent for the labor included in the cost of machine hire was to be considered as part of the total expenditure. The cost of freight or trucking and excbange work without pay were to be omitted.

Hired Labor.-Expenditures for hired labor were to include total cash payments made in 1959 to family members and to others for farm labor. Payments to persons suppied by a contractor or a cooperative organization and paid directly by them or by the crew boss were also to be included. Parments
for the following types of work were to be excluded: housework, contract construction work, custom machine work, and repair, instaliation, or construction work done by persons spe ciffcaily employed for such work.

Gasollne and Other Petrolenra Fiel and 0il.-Expenditures for gasoine and other petrolenm fuel and oil were to relate only to the products used in the farm business. Enumerators were instructed to exciude the cost of petroleum products used for the family automobile when operated for other than farm business purposes and of products used in the farmbouse for heating, cooking, and ifghting.

Seeds, Buibs, Plants, and Trees.-Expenditures were to represent the total amount spent for seeds, buibs, plants, and trees to be used on the farm operated. The vaiue of seed grown on the farm was to be exciuded. For nurseries and greenhouses, the cost of products purchased for immediate resale was aiso to be excluded.

This item of expenditure was not included in the 1954 Census. The data are comparabie with those for 1950, however.

## Crops

Crops Harvested.-The 1959 agriculture questionnaire was similar to the questionnaire used in several previous censuses in that it provided for the coliection of detailed data for all crops harvested on each individual farm. The variation in the crops ilsted on the questionnaires used in different States made possibie the separate reporting of all important crops grown in a given area. Ali versions of the questionnaire contained several "All other crops" questions where crops not specifically listed in separate questions were to be reported.

Acreage of Crops Harvested. - In most instances, the acreage reported for individuai crops represents the area harvested during 1959. The area harvested is often less than the area planted. For fruit orchards and groves, vineyards, and planted nut trees, the acreage reported represents the total area in both bearing and nonbearing trees and vines as of the date of enumeration-usually a date in October, November, or December 1959. For soybeans, cowpeas, and peanuts, the acreage grown for all purposes was reported as weil as the acreage harvested for specific purposes. For veivet beans, only the acreage grown was reported. As the enumeration was about to begin in South Florida (those counties in which the enumeration was begun on October 7), an instruction was issued to the effect that the data for vegetables and potato crops should relate to a full year, beginning on October 1, 1958, and ending September 30, 1959.

Quantity of Crops Harvested.-Except for citrus fruits, olires, avocados, and for vegetable and potato crops in South Florida (see preceding paragraph) data for quantity harvested relate to the calendar year 1959. For citrus frnits, the quantity harvested from the bloom of 1958 for the 1958-59 marketing season was to be reported. For ollves, the crop barvested in 1959 was to be reported for all States except California and Arizona. Enumerators in those two States were instructed to report olives harvested from the bioom of 1958 during the 195859 harvest season (September 15, 1958, to February 28, 1959). In the case of avocados, the data for California were to relate to the quantity harvested from the bloom of 1958 for the marketing season that extended from October 1, 1958 to September 30, 1959; the data for Fiorida were to relate to the crop harvested for the marketing season that extended from July 1, 1959, to February 28, 1960. Respondents were to estimate quantities not yet harvested at the time of enumeration.

Unit of Measure.-The unit of measure in which quantities were to be reported has varied for some crops, not only from State to State, but also from census to census. The aim has been to permit reporting in the units of measure currently in use. In the State and county tables, the quantities barvested for each crop are usualiy expressed in the unit of measure given on the 1959 agriculture questionnaire. In 1959, for corn and Irish potatoes, a choice between two units in which to report the production was given in some States. (See the discussion for those crops.) To provide readily comparable information, data published in earlier reports in different units of measure generaily have been converted to the units used in 1959.

Corn.-In the 1959 census, detailed questions regarding the purpose for which corn was harvested were asked in all States. For most States, busbels was the only unit specified for corn
for grain. In some areas, however, where farmers were not accustomed to using bushels as the unit of measure, the questionnalre contained a provisiou for the quantity of corn for grain to be reported either in busbels (shelled basis) or in baskets of ear corn. As in former censuses, some reports were received In units of measure other than bushels or baskets. Prior to tabulation, all reports were conrerted to bushels (shelled basis) on the basis of the following factors: 70 pounds of ear corn, 2 baskets of ears, or 56 pounds of shelled corn equal one bushel. A barrel of ear corn was usually considered equal to 5 bushels of shelled corn.

Annual Legumes.--For soybeans, cowpeas, and peanuts, the acres and quantity grown or harvested for specific purposes, as well as the total acreage grown for all purposes, were obtained for areas where these crops are grown extensively; for velvetbeans, only the total grown for all purposes was obtained. For all these crops except, possibly peanuts, the total acreage grown for all purposes includes some acreage that was plowed under for green manure. In a few Southern States, separate figures were obtained for the acres grown alone and the acres grown with other crops. In 1959 , as in 1954 , enumerators were lnstructed to report green soybeans and blackeyes and other green cowpeas haryested for sale as regetables and not as annual legumes.

Hay Crops.-Data for the total acres of land from which hay was cut exclude the acreage in sorghum, soybean, cowpea, and peanut hays. These crops were reported in separate questions in the States where they are important. To obtain the total acres from which other hays were cut, the acres of the various hay crops, including grass silage, were added together for each county. The corresponding totals for 1954 were obtained by the same procedure. For the 1950 census, however, the totals were based on farmers' own reports of their total acreage in harvested hay crops.

The questionnaire contained an instruction that if two or more cuttings were made from the same land, the total production from all cuttings was to be reported but the acres cut were to be counted only once. In cases where both hay and grass silage were cut from the same land, the total acreage was to be reported for both crops. In 1959, as in 1954, alfalfa hay included alfalfa and alfalfa mixtures for hay and for dehydrating; clover and timothy hay included clover, timothy, and mixtures of clover and grasses; small grain hay included oats, wheat, barley, rye, or other small grains cut for hay. The hay crops listed on the questionnaire varied somewhat from one State or region to another. The kinds of hay to be included in separate questions can be determined for a specific State from reference to the facsimile of the questionnaire that is in the appendix.

The tonnage of hay, lacluding alfalfa hay for dehydrating, is given on a dry-weight basis. Prior to tabulation, production reported in green weight was converted to its dry-weight equivalent by divlding by 3. However, the production of grass silage is given in terms of green weight.

Field Seed Crops.-The field seed crops listed on each version of the questionnaire were llmited to those considered most lmportant within the given State. Each verslon of the questionnaire contalned space for listing other field seed crops in order to facilitate the reporting of all field seed crops harvested. Quantity harvested was to be reported in terms of clean seed for most field seed crops. Bluegrass, or Junegrass seed, was to be reported in terms of green seed for Iowa, Kansas, Kentucky, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Tennessee. No mention was made of "green-weight basis" for other States where this crop was to be reported in the "All other" question.

Irish Potatoes and Sweetpotatoes.-For Irlsh potatoes and sweetpotatoes (including jams), the total quantity harvested was to be reported for each crop $\ln$ all cases, whether harvested for
home use or for sale or whether used for livestock feed. The acreage harvested was to be reported for each crop only in cases where the quantity amounted to 20 or more bushels (or the approximate equivalent in terms of hundredweights, barrels, or pounds, as explained on different versions of the questionnaire). This method of reporting was designed to facilitate the enumeration of potatoes harvested on small plots for home use. Essentially the same procedure was followed in both 1954 and 1950. In earlier censuses, however, the acreage of Irish potatoes and sweetpotatoes was to be reported in all cases, even when production was solely for home use. Therefore, the data on acres for censuses prior to 1950 are not fully comparable with those for the last three censuses, especially in counties or States where production is largely for home use.

The unit of measure in which quantity was to be reported varled from one State or region to another to correspond with the units most commonly used in a given area. In 27 States, the questionnaire provided a choice for reporting either bushels or 100 -pound bags (hundredweights). The published data for counties and States are in terms of bushels.

Berries and Other Small Fraits.-The questlon for berries and other small fruits related specifically to the acreages and quantlties harvested for sale. Only tame or cultivated berries were to be reported except for the New England States, where wild blueberries were also to be included. Enumerators were instructed always to report the total quantity of each kind of berry harvested for sale but to report the area harvested only when it amounted to one-tenth acre or more. Nonbearing areas and areas and quantities harvested for home use were to be excluded. The data for 1959 and 1954 are fully comparable.

Tree Fruits, Nuts, and Grapes.-In 1959, as in 1954, fruit trees, nut trees, and grapevines were not enumerated for farms having a comblned total of less than 20 at the time of enumeration. Both bearing and nonbearing trees and vlnes were to be included but not any that had been abandoned. For censuses prior to 1954, all fruit or nut trees and grapevines on the farm were to be enumerated, regardless of the number. Because of this change in enumeration procedure, the data for 1959 and 1954 are not fully comparable with those for earlier censuses. In commercial fruit-producing countles, the change in procedure may have had a considerable effect on the number of farms reporting without causing any signlficant changes in the number of trees and vines nor in the quantity harvested. In counties where most of the trees or vlnes are in small plantings and where productlon is largely for home-use, however, the change may have caused a significant reduction not only in the number of farms reporting but also in the number of trees and vines and ln the quantity harvested.

In both 1959 and 1954, the area in fruit orchards, groves, vineyards, and planted nut trees was enumerated when there were 20 or more fruit trees, nut trees, and graperines. In 1950 , the corresponding area was enumerated only if it amounted to one-half acre or more. In censuses prior to 1950 , the area was to be reported regardless of its size or of the number of trees and vlnes. Enumerators frequently omitted the fractlonal acreages In small plantings and home orchards, however. In some countles, small plantings or home orchards comprlse a sizeable proportion of the total frult and nut acreage. For those countles, the change from one census to another ln acreage of land in fruits and nuts may not be due to fact but merely to differences in enumeration.

In 1959, Callfornia was the only State for which the acreage in each individual fruit and wut crop was obtalned. In 1954, such acreage was also obtalned for Arlzona. In all States, the number of bearing and nonbearlng trees or vines on the farm at the time of enumeration and the quantly harvested in 1959 were to be reported separately for each fruit and nut crop. (Exceptions in the harvest period for citrus frults, avocados, and
olives are described on p. XIX.) The unit of measure in which quantities were to be reported raried from one State to another. Tables ln this report show quantities in the unit of measure appearing on the 1959 questionnaire used in the State.

Nursery and Greenhonse Products.-The questions about mursery and greenhouse products related only to products grown on the place for sale. Crops bought for resale without additional cultlvation were to be excluded. The area used for growing and the value of sales were to be reported separately for each of three groups, as follows:
a. Nursery products, (trees, shrubs, vines, and ornamentals).
b. Cut flowers, potted plants, florist greens, and bedding plants. For these items, the area grown in the open was to be reported separately from the area grown under glass.
c. Vegetables grown under glass, flower seeds, vegetable seeds, vegetable plants, bulbs, and nushrooms. For these items, the area grown in the open was to be reported separately from the area grown under glass or in the house.
The data obtained for 1959 are comparable with those for 1954 and 1950 since the questions asked were essentially the same in the three censuses. Detailed data regarding the production and sale of nursers, greenhouse, and other horticultural products on farms having sales of $\$ 2,000$ will be published in volume V, part 1.

Forest Products.-The forest products data obtained in the Census of Agriculture relate only to the products cut on farms. Conmercial logging, timber operations, and forest products grown or cut on nonfarm places are excluded. Therefore, the data in this report do not represent the total forestry output or income for a county or State.

The questions included on the $19: 9$ agriculture questionnaire are more detailed than those asked in the 1954 Census. Value was obtained for the sale of standing timber or trees and for the sale of poles and piling, bark, bolts, and mine timbers. The quantity cut, whetber for home use or sale, and the quantity sold were obtained for individual forestry products such as firewood and fuelwood, fence posts, sawlogs and veneer logs. Data relating to pulpwood, Christmas trees, maple trees, and maple syrup were ohtained in States where such products are important commercially.

Valne of Crops Harvested.-The total value of crops harvested represents the estimated value of all crops harvested during the crop year 1959. It includes the value of quantities consumed on farms as food, feed, seed, etc., as well as quantities sold. Farmers were not asked to report values of crons barvested; the values were calculated in the Processing Othce. Fur individual crops, the quantity harrested was multiplied by the average price at which the crop was sold in the State. State average mrices were furnished to the Bureau of the Census by the Agricultural Marketing Service of the U.S. Department of Agriculture. They are based on reports received from a sample of farmers and dealers. Quantities harvested were not obtained for vegetables nor for nursery and greenhouse products. Therefore, for those crops, the value of sales, as obtained in the enumeration, was used in the calculation of total value of crops harrested.

Value of Crops Sold.-The questionnaire required value of sales of crops to be reported only for total vegetables, nursery and greenhouse products, and certain forest products. For all other crops, the value of sales was calculated on a county level during processing operations by multiplying the State average prices by either the quantity sold or the quantity harrested. Reports of quantity sold were obtained during the enumeration only for some of the major field crops. Quantity barrested was used in the calculation of value of crops sold for such crops as cotton, tobacco, etc., that are customarily grown for sale. The procedures used for the various crops are described on page XXV. They
are simllar to the procedures followed in 1954. In 1950, values of crops sold were obtained for each farm during the enumeration.

## Ibrioation

Definltion of Irrigated Land.-Irrigated land is defined as land watered for agrlcultural purposes by artificial means. These means included subirrigation as well as systems whereby water was applied to the ground surface, either directly or by sprinklers. Land flooded for rice cultivation was considered as irrigated. Land flooded during high-water periods was to be included as Irrigated only if water was directed to agricultural use by dams, canals, or other works. The definition of irrigated land specifically excluded land where the "water table", or natural level of underground water, was controlled by drainage works with no additional water brought in by canals or pipes.
Enumeration of Irrigated Land.-A question on total land irrigated was asked in all States, with the exception of Alaska. The acreage reported for this question includes not only irrigated cropland but also any other land that was irrigated in 1959.
The questionnaires used in the 17 Western States, Louisiana, and Hawaii included several additional questions regarding irrigation. These questions related to the acreage of land irrigated by sprinklers, irrigated land from which crons were harvested, specific crops irrigated, and source of irrigation water. Such additional data, for irrigated farms, are presented in county table 1 a for these States.

Statistics on the irrigation enterprises which supplied irrigation water were collected in the 1059 Census of Irrigation and are published in Volume III, "Irrigation of Agricultural Lands". This report contains a considerable amount of data about irrigation for the 17 Western States and Louisiana.
Irrigated Farms.-All farms reporting any land irrigated in 1959 are counted as irrigated farms.
Land in Irrigated Farms.-Data for land in irrigated farms according to use relate to the entire acreage in these farms, including land that was not irrigated.
Land Irrigated.-Data for land irrigated relate only to that part of the land in irrigated farms that was watered by artificial means at any time in 1959. Separate figures are given for farms reporting land irrigated by sprinklers whether or not the land was also irrigated by other means. Additional figures are given for farms reporting land irrigated by sprinklers only. Data on sprinkler irrigation were not obtained in the 1954 census.

Irrigated Cropland Harvested. -The data for irrigated cropland harvested relate to all irrigated land from which erops were harvested in 1959 , regardless of the method of irrigation. An instruction on the questionnaire reminded enumerators and respondents to include irrigated land from which hay was cut, irrigated land in both bearing and nonbearing fruit and nut crops, and irrigated land from which rolunteer crops were harcested. Each irrigated acre was to be reported ouly once, regardless of how many crops were harvested from it.

Other Irrigated Land.-This classification was obtained by subtraction of the acreage of irrigated cropland harvested from the acreage of total land irrigated. It represents primarily irrigated cropland not harvested and irrigated pasture or grazing land.
Farms Irrigated By Number of Acres Irrigated.-All farms on which any land was irrigated in $19 \overline{9} 9$ are classified accordiug to the number of acres irrigated in county table 1a for the 17 Western States, Louisiana, and Hawaii. This classification is based on total land irrigated. Therefore, it includes not only the irrigated land from which crops were harvested bit also all other irrigated land, regrardless of use.

Iand Irrigated By Source of Water. -The agriculture questionnaire contained a question as to what proportion of irrigated water used on the farm in 1959 was obtained from ground. water, surface-water, and irrigation-organization sources. Respondents were asked to report separately the percentage of
water obtained from each source. The number of acres that were irrigated by water from each source or combination of sources was calculated during office processing operations by applying the percentages to the total land irrigated.

Ground-water sources relate to wells (pumped or flowing) and springs; surface-water sources relate to streams, lakes, reservoirs, and sewage and drainage ditches. For each of these sources, only water obtained by pumps or other works operated as part of the operator's own farm or as part of another single farm was to be inciuded. Irrigation-organization sources relate to irrigation enterprises organized to supply water to a group of farms, regardless of how or where the enterprise obtained the water. The irrigation enterprise may be a legal organization or a group of farmers informally organized to operate a supply ditch or other works to provide water for their own farms.

## Land-Use Practices

Summary Information.-The 1959 data for land-use practices are estimates based on reports ohtained from only a sample of farms. Comparable data are not presented for 1954 because questions about land-use practices were included on the 1954 questionnaire for only a limited number of states. The various land-use practices relate to methods for reducing soil erosion, elther by improving the soil, controlling the run-off of water, or reducing the blowing of topsoil.

Cropland in Cover Crops.-The data relate to land on which cover crops were turned under for green manure in 1959 and which was then planted to another crop. The entire acreage of cover crops so used was to be reported even if the following crop failed.

Cropland Used for Grain or Row Crops Farmed on the Contour.This ltem relates to land on which grain or row crops were planted in level rows around the slope of a hill.

Land in Strip-Cropping Systems for Soil-Erosion Control.-Stripcropping was defined as the practice of alteruating close-sown crops with strips or bands of row crops or of alternating either closesown or row crops with bands of cultivated fallow land. The published data refer to the total acreage of all fields and tracts in which strip-cropping was practiced in 1959.

System of Terraces on Crop and Pasture Land.-This item relates to the acreage in ridge-type or channel-type terraces constructed on sloping cropland and pastureland.

## Livegtock and Poultry

Inventories.-Data for livestock and poultry on farms relate to the number on hand at the time of enuneration. All livestock and poultry, including those being kept or fed under contract, were to be enumerated on the farm or ranch where they were, regardiess of who owned them. Livestock in transit from one grazing area to another or grazing in national forests, grazing districts, open range, or on land used under permit were to be reported as being on the place where the person who had control over them had his headquarters.

The time of sear at which livestock and pouitry are enumerated affects the data. Therefore, the date of enumeration needs to be considered when totals for the various censuses are compared. Both the 1959 and the 1954 census data represent fall inventories. These censuses came at a time of large-scale movement of flocks and herds from one range to another, from ranch to feed lot, and from farm or ranch to market.

The censuses of $1920,1925,1935$, and 1945 were taken as of January 1 and those of 1930, 1940, and 1950, as of April 1. A count made in April varies considerably from one made in January. In most areas a large number of animals are born hetween January and April. A considerable number of older animals die or are sold during the same period. In the range States, along
with the change in season and grazing condition, sheep and cattie are mosed from one locality or counts to another. This movement may affect the comparability of data for counties and, in some cases, for States. The comparability of data by age has been affected also by changes in the questions from one census to another.

Milk Cows, Cows Milked, Milk Produced, and Butter.-Data on the number of milk cows, cows milked, and milked produced relate to the day preceding the enumeration. Data for butter churned were obtained only for 14 States and relate to the calendar week preceding the enumeration. The data for cows milked yesterday and milk produced yesterday are not giren in this volume. These figures were obtained primarily to serve the needs of the U.S. Department of Agriculture in making monthly and annual estimates of milk proluction. These figures can be made arailable, at a small cost, to others who express an interest in them.

Whole Milk and Cream Sold.-Data for whole milk and cream sold relate to the entire year 1959 and are estimates based on reports obtained for farms in the sample. All milk and cream sold from the farm (except quantities purchased from some other place and then resold) were to be included, regardless of who shared the receipts. The questionnaire provided three alternative units of measure for reporting the quantity of milk sold-pounds of milk, gatlons of milk, and pounds of butterfat. The respondent was thus permitted to report quantity according to the unit of measure in which payment was received. In the State and county tables, the data for milk are given in the unit of measure most commonly used in the State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of milk as shown by data furnished by the Agricuitural Marketing Service of the U.S. Department of Agriculture.

Sows and Gilts Farrowing.-In the 1959 census, data were obtained for the number of litters farrowed between December 1 , 1958, and June 1, 1959, and from June 1 to December 1, 1959. In the 1954 census, data were obtained for the sows and gilts that farrowed rather than for the number of litters.

Sheep, Lambs, and Wool.-In the 1959 census, questions about sheep, lambs, and wool were asked in all States. Data on shearings and on amount of wool shorn were obtained for lambs and sheep separately. In the 1954 census, sheep and lamb inventories were not obtained for Florida, Georgia, and South Carolina.

Goats and Mohair.-In 1959, questions on goats, kids, and mohair appeared on the questionnaires for the following nine States: Arizona, California, Missouri, Nevada, New Mexico, Oklahoma, Oregon, Texas, and Utah. In 1954, corresponding data were obtained for Louisiana, New Mexico, Oklahoma, Oregon, Texas, Washington, and selected counties in Missourl.

Bees and Honey.-No questions on bees and honey were included on the questionnaires for either the 1959 or the 1954 census. In 1959, Lomever, enumerators were instructed to obtain agriculture questionnaires for places not having agricultural operations if they were engaged in beekeeping. The number of hives of bees and the amount of honey sold were to be reported in the "Remarks" space of the questionnaire. Data for bees and honey are not included in this report.

Value of Livestock on Farms.-To obtain the value of livestock on farms, the number of each class of livestock or poultry on hand was multiplied by the State average price for 1959, as furnished hy the Agriculturai Marketing Service of the U.S. Department of Agriculture. Comparable data for 1954 were compiled by the same method on the basis of average prices for that year.

Sales of Live Animals.-Data for the number and value of animals sold alive in 1959 are estimates based on reports for sample farms only. Corresponding data for 1954 were obtained for all farms. The dollar value of sales was obtained from the farmer
for cattle, calves, and horses and mules. Average value per head for other llvestock sold was obtained from the U.S. Department of Agriculture. In the 1959 census, respondents were asked to report separately the number of llve animals aiready sold and the number estlmated to be sold between the tlme of enumeration and the end of the year. Thls separation of reports for the number sold and to be sold was designed to assure more complete coverage of all livestock sales made during the year. In the 1954 census, only totals for the entire year were obtalned though reference was made to anlmals to be sold between enumeration and the ead of the year.

Sales of Poultry and Poultry Products.-For both the 1959 and the 1954 Censuses, sales of chickens were obtained for two groups: (1) brollers and (2) other chlckens. The enumeration of broiler sales presents prob'ems arising from the varied contractual arrangements under which brollers are produced. The questionnalre contained an instruction to the effect that all broilers grown for others under contract were to be reported as sold. During office processing operations, the data reported for inventorles and sales of chickens four months old and over, chicken eggs sold, and brollers sold were carefully examined. Obvious inconsistencies indicating confusion between brollers and other chlckens were corrected on the basis of estimated values and, for sample farms, on the basis of data reported for expenditures for feed, poultry and ilvestock purchases, hlred iabor, etc.

Questions reiating to poultry other than chickens (and broilers) were generally the same $\ln 1959$ as $\ln 1954$. In the 1959 census, however, only totai numbers were obtained for turbeys and turkey fryers raised and for turkey hens kept for breeding whereas the 1954 questlonnaire asked for a breakdown between light and heavy breeds. Also, for poultry other than chlckens and turkeys, the 1959 census obtalned the number sold whereas the 1954 census obtained the number raised.

## Classification of Farms

Scope of Classification.-Data for land in farms, and for cropland harvested in farms ciassifled by size, by color of operator and by tenure of operator were tabulated for all farms. However, most of the detailed data by size of farm, by color of operator, by tenure of operator, by economic class, and by type of farm are estimates based on farms in the sample. The farm classifications by size of farm, color of operator, tenure of operator, economic class of farm, and type of farm were made in the processing office on the basis of data reported on each questionnaire.
Farms by Size.-Farms were classified by size according to the total land area established for each farm. The same classification was used for all States. According to definition, a farm ls essentially an operating unit, not an ownership tract. All land operated by one person or partnership represents one farm. In the case of a landlord who has assigned land to croppers or other tenants, the land assigned to each cropper or temant is considered a separate farm even though the landlord may operate the entire landholding as one unit in respect to supervision, equipment, rotatlon practice, purchase of supplies, or sale of products. In some parts of the South, a special Landlord-Tenant Questionnaire was used to assure an accurate enumeration of each unit within a multiple-unit operation. A change was made in the size classification for 1959, as contrasted with several preceding years, by subdividing the 1,000 -acre-and-over group and by combining two previously recognized groups, viz., 10 to 29 acres and 30 to 49 acres.
Farms by Color of Operator.-Farms were classified by color of operator into two groups, "white" and "nonwhite." "Nonwhite" includes primarily Negro and Indian operators but also some of other racial origin.

Enumerators were instructed to report the race on the basis of thelr own observation whenever possible rather than by asking the respondent.

Farms by Tenure of Operator.-The classification of farms by tenure of operator was based on data reported for land owned, land rented from others or worked for others on shares, land managed for others, and land rented to others or worked on shares by others. The same basis of classification was used ln 1959 as in 1954.

For 1959 , each questionnaire was coded, during the editing process, to indicate whether it represented a farm operated by a full owner, part owner, manager, or tenant. The sample questionnaires for tenants were given a code to ludlcate the kind of tenant.

The varlous classifications of tenure, as used for the 1959 census, are defined below:
a. Full 0 wners operate only land they own.
1). Part Owners operate land they own and also iand rented from others.
c. Managers operate land for others and are paid a wage or salary for their services. Persons acting lnerely as caretakers or hired as laborers are not classified as managers. If a farm operator managed land for others and also operated iand on hils own account, the land operated on his own account was considered as one farm and the land managed for others as a second farm. If, however, he managed land for two or more employers, all the managed fand was considered to be one farm.
d. Tenants rent from others or work on shares for others all the land they operate. They are further classiffed, as described below, on the basis of rental arrangements in regard to the payment of cash rent, sharing of crops, sharing of livestock or livestock products, and the furnishing of work power by the landlord.
(I) Cash Tenants pay cash rent, either on a per-acre basis or for the farm as a whole.
(2) Share-Cash Tenaats pay part of the rent in cash and part in a share of the crops and/or of the llvestock and livestock products.
(3) Crop-Share Tenants pay a share of the crops but not of the livestock or livestock products.
(4) Livestock-Share Tenants nay a share of the livestock or livestock products. They may or may not also pay a share of the crops.
(5) Croppers are tenants whose landlords furnished all the work animals or tractor power. They usually work under the close supervision of the landowners or their agents, or other farm operators. Also, the land assigned to them ls often merely a part of a multl-unit operation. Croppers may or may not also pay cash rent or a share of crops, livestock, or livestock products. Data for croppers are available for only 16 southern States and Missouri.
(6) Other Tenants are those who did not qualify for inclusion in any of the foregolng subclassifications. They may bave had the use of land rent-free or in return for a fixed quantity of products, payment of taxes, maintenance of buildings, etc.
(7) Unspecified Tenants are those for whom the rental arrangement was not reported.
The definition of each subclass of tenant was essentially the same for earlier censuses as for 1959. In 1945, however, the enumerator was asked to determine the subclass of tenants whereas in other censuses all classifications were made during the processing of questionnaires on the basis of the data reported. The procedure used in 1945 may have affected the comparabllity of the data, especially for cash tenants and share-cash tenants.
Farms by Economic Class.-The totals for farms by economic class are estimates for all farms made on the basis of data reported only for the sample farnis. The economic classifications represent groupings of farms that are similar in characteristics and size of operation. The economic classes were established on the basis of one or more of four factors : (1) total value of all farm products sold, (2) number of days the farm operator worked off the farm, (3) the age of the farm operator, and (4) the relationship of income received by the operator and members of his household from nonfarm sources to the value of all farm products sold. Institutional farms, Indian reservations, agricultural experiment stations, and grazing associations were always classified as "abnormal."

The total value of farm products sold was obtalned hy additlon of the reported or estimated values for all products sold from the farm. The value of cattle and calves, horses and mules, dairy products, some poultry products, vegetables, nursery and greenhouse products, standing timber, and miscellaneous forest products was obtained from the farm operator during the enumeration. The quantity sold was obtained during euumeration for corn, sorghums, small grains, has, small fruits, some of the forest products, chickens and chicken eggs, hogs, sheep, and goats. To obtain the ralue of sales of these products, the quantits sold was multiplied by State arerage prices.

For each of the other products, the entire production was multiplied by the State average price. If the resulting value amounted to $\$ 100$ or more, the entire quantity produced was considered as sold. This procedure was followed only in establishing the economic class and the type of farm but was not used in establishing the total value of products sold from the farm. (See p. KXV.)

Farms were grouped into two major categorics, commerclal farms and other farms, mainls on the basis of total value of produets sold. The 1959 class intervals and some of the criteria for determination of a given class are different from those used in 1954 and in 1950. In general, for 1959 , all farms with a value of sales amounting to $\$ 2,500$ or more were classified as commercial. Farms with a falue of sales of $\$ 50$ to $\$ 2,499$ were classified as commercial if the farm operator was under 65 jears of age and (1) he did not work off the farm 100 or more days during the year and (2) the incone received by the operator and members of his family from nonfarm sources was less than the value of all farm products sold. The remaining farms with a value of sales of $\$ 50$ to $\$ 2,499$ and institutional farms and Indian reservations were included in one of the gromps of "other farms."

Commercial farms were divided into six economic classes on the basis of the total value of all farm products sold, as follows:

|  | Valuc of Farm <br> Products sold |
| :--- | :--- | :--- |
| Class of $F$ Farm | $\$ 0,000$ and over |

*Prorlded the farm operator was uoder 65 years of age, and-
(1) he did not work of the farm 100 or more days, and (2) the in. come that he a members of his household recelved from noofarm sources was less thaa the total value of farm products sold.

Other farms were divided into three economic classes as follows:
a. Class VII, Part-time-Farms with a value of sales of farm products of $\$ 50$ to $\$ 2,499$ were classified as "part-time" if the operator was under 65 years of age and he either worked off the farm 100 or more dass or the income he and members of his household received from nonfarm sources was greater than the total value of farm products sold.
b. Class VIII, Part-retirement.-Farms with a value of sales of farn products of $\$ 50$ to $\$ 2,499$ were classified as "partretirement" if the farm operator was 65 years old or over. Many of these are farms on which the income from nonfarm sources was greater than the ralue of sales of agricultural products. Others are residential, subsistence, or marginal farms. In previous censuses, the age of the farm operator was not a criterion for grouping farms by economic class. Since the number of elderly people in our population has been steadily increasing during recent sears, a separate classiflcation for farms operated on a part-retirement basis was considered Important for an adequate analysis of the agricultural structure of a county or State.
c. Class IX, Abnormal.-All Institutional farms and Indian reservations were classified as "abnormal," regardless of the value of sales. Institutional farms include those operated
by hospitals, penitentlaries, schools, grazing assoclations, government agencies, etc.
Farms by Type.-The data for farms by type are estimates based on data tabulated for the farms in the sample. The type represents a description of the major source of income from farm sales. To be classified as a particular type, a farm had to lave sales of a particular product or group of products amounting in value to 50 percent or more of the total value of all farm products sold during the year.

The types of farms, together with the products on which type classification is based, are as follows:

| Type of Farm | Source of Cash Income |
| :---: | :---: |
|  | (Products with sales value representing $50 \%$ or more of total value of all farm products sold) |
| Cash-grain | Corn, sorghums, small grains, soybeans for beans, cowpeas for peas, dry field and seed beans and peas. |
| Tobacco | Tobacco. |
| Cotton | Cotton. |
| Other field- | Peanuts, potatocs (Irish and sweet), sugarcane for sugar or sirup, sweet sorghums for sirup, broomcorn, popcorn, sugar beets, mint, hops, and sugar beet seed. |
| Vegetable | Vegetables. |
| Fruit-and-nut | Berries, other small fruits, tree fruits grapes, and nuts. |
| Poultry | Chickens, chicken eggs, turkeys, and otler poultry products. |

Dalry _-_-.-.-.-.-. Milk and cream. The criterion of 50 percent of total sales was modified in the case of dairy farmis. A farm haring value of sales of dairy products amounting to less than 50 percent of the total value of farm products sold was classified as a dairy farm, lf-
(a) Milk and cream sold accounted for more than 30 percent of the total value of products sold and-
(b) Milk cows represented 50 percent or more of total cows aud-
(c) The value of milk and cream sold plus the value of cattle and calves sold amounted to 50 percent or more of the total value of all farm products sold.
Livestock other than
dairy and poultry_-...-. Cattle, calves, hogs, sheep, goats, wool and mohair except for farms in the 17 Western States, Louisiana, and Florida that qualified as livestock ranches.
Livestock Ranches__... Farnis in the 17 Western States, Louisiana, and Florida were classified as livestock ranches if the sales of livestock, wool, and mohair represented 50 percent or more of the total value of farm products sold and if pastureland or grazing land amounted to 100 or more acres and was 10 or more times the acreage of cropland harvested.
General_-_-_-............ Field seed crops, hay, silage. A farm was classifled as general also if It had cash income from three or more sources and did not mect the criteria for any other type.
Miscellaneous_------.-. Nursery and greenhouse products, forest products, mules, horses, colts and ponies. Also all institutional farms and Indian reservations.

The type classifications were essentially the same for the 1959 as for the $195 \pm$ census except that tobacco farms and livestock ranches were not separately classified in 1954 . Tobacco was included as one of the crops used in the classification of "other field crop" farms in 1954. The farms ctassified as livestock ranches in 1959 would have been classified as "livestock other than dairy and poultry" in 1954 withont regard to the acreage in pasture.

Value of Farm Products Sold. -Data for the vatue of farm products sold in 1959 were obtalned by enumeration for some products and by estimation for others. The questionnaire used for the 1959 census provided for farm operators to report value of sates for the following products:
Vegetables Miscellaneous poultry products
Nursery and greenhouse products Milk and cream

Standing timber Cattle

Miscellaneous forest products Horses, mules, colts, aud ponies
For alt other agricultural products, the value of sales was estimated during the office processing. The State average prices used for calculating the value of farm products sold were furnished to the Bureau by the Agricultural Marketing Service of the U.S. Department of Agriculture. One of three following procedures was used.
(1) For the products for which data on quantities sold were obtained during enumeration, the State arerage prices were multiplied by the county totals of the quantities reported as sold or the quantities reported as produced for sate. The foltowing products were covered by this procedure :

| Corn for grain | Fence posts |
| :--- | :--- |
| Sorghums for grain, seed, sirup, | Sawlogs and veneer logs |
| or dry forage | Christmas trees |
| All small grains | Chickens (broiters and others) |
| Hay erops | Chicken eggs |
| All berries and small fruits ${ }^{1}$ | Hogs and pigs |
| Firewood and fuelwood | Sheep and lambs |
| Pulpwood | Goats and kids |
| 1 Adjustment made for cranberrles based on Cranberry payment |  |
| Program. |  |

(2) For most of the agricultural products which are customariiy raised for sale, the entire quantity produced was considered to be sold. The State arerage prices were, accordingly, multiplied by the county total of production. The following crops were covered by this procedure:

Cotton
Popcorn
Sugar beets for sugar
Broomeorn

Sugarcane for sugar
Tobaceo
Wool
Mohalr
(3) For all other crops, the State average prlces were multiplied by the quantlies sold as estimated on the basls of cropdisposition data furnished by the Agricultural Marketing Service, data reported in questions for "other crops" on the 1959 questionnaire, or data obtained from earlier censuses.
For atl tree fruits, nuts, and grapes, the entire quantity produced was considered as sotd, except for apples, apricots, sour and sweet cherries, peaches, plums, prunes, avocados, tangerines, oranges, and grapefruit in States where a portion of the crop was not harvested or was subjected to excess cullage as indicated by data obtained from the Agricultural Marketing Service of the U.S. Department of Agriculture.

The data for 1959 are comparabte with those for 1954 slnce essentlally the same procedures were used in both censuses for estimating quantities and values of farm products sold. In 1959, as in 1954, data for the sales of farm products represent totai sales for the entire farm, regardless of who shared the recelpts. For tenant-operated farms, the landlord's share of agricultural products was considered as sold provided the products were moved off the tenant farm. All crops, livestock, and poultry raised under a contract arrangement were considered as sold from the farm where they were ratsed. Hor institutional farms, all agricultural items produced on land operated by the institution and consumed by the inmates were to be reported as sold.

All sales data relate to one year's farm operations. Crop sales are for crops harvested during the crop year, whether the crops were actually sold immediately after harvest or placed in storage for later sale. Sales of lirestock and livestock products relate to the calendar year, legardless of when the livestock or products were raised or produced. All wool and mohair reported as shorn or clipped was considered as sold.

Enumerators were instructed to record gross values of quantities sold, with no deductions for feed, seed, fertilizer, water, labor, or marketing costs. For some products, however, net values may have been reported. In the case of milk, particularly, some farm operators may have reported the payments they received as the gross value of sales, even though the buyer had deducted handling and hauling charges before making payment. Adjustments were made in the data reported only in cases of obvious error.

## Chapter A

## STATISTICS FOR THE STATE

 harvested for grain.
${ }^{3}$ Value of corn and other corn products sold.
${ }^{5}$ Corn cut for forage.
${ }^{5}$ Sorghums for all purposes, except for sirup.
${ }^{6}$ Value of sorghums sold for hay or forage included in value of sorghums sold for grain or seed.
${ }^{7}$ The 1944 and 1939 figures do not include acres plowed under for green manure. The 1944 figures are for acres grow alone.
${ }^{8}$ Soybeans and coupeas cut for hay.
${ }^{9}$ For ligures on annual legunes saved for hay, including soybeans and compeas, see peanut vines or tops saved for hay or forage.
10 Farms reporting for acres grown alone only.
${ }^{12}$ Calculated value of peanuts harvested for nuts, peanuts harvested for hay, and peanuts hogged or grazed.
${ }^{12}$ Reported in trushels.
${ }^{13}$ Frior to 1944, annual legumes saved for hay. but excluding vetches in 1924.
Excludes reports for farms reporting acreage grom for all purposes ith no production. Acres harvested for beans not avallable,
${ }^{15}$ Includes acres grom alone and acres grown with other crops for all priposes. Acres harvested for beans not available.
${ }^{16}$ For all Censuses, except 1950, obtained by adding the individual hay crops.
${ }^{17}$ In cm ludes oats cut for feeding unthreshed.
${ }^{18}$ Silage crops other than corn and sorghums.
29 clover seed. except s:eetclover.
${ }^{20}$ Clover seed, including speetclover
${ }^{21} 2$ tncludes proso tollet.
22 value of $11 n t$ cotton only.
 See text.
${ }^{24}$ Includes receipts from sale of pasture and gra:ing privileges.
${ }^{25}$ Excludes Irish potatoes and sweetpotatoes, except for the 1920 Census which inaluded potatoes for hame use only
${ }^{20}$ Eycludes Irish and sweet potetoes.
${ }^{2}$ Includes green lima bean
${ }^{28}$ Includes hat peppers.
${ }^{29}$ For Censuses prior to 1950, small frults harvested cor home use or for sale.
${ }^{30}$ Loganberries and yountberries included with boysenberries.
${ }^{31}$ For 1959 and 1954 . does not include date for farms orfth less than 20 trees and grapevines. See text.
${ }^{32}$ Does not include anreage for farms reporting less than $1 / 2$ aure. See text.

Part 1 of 8.-Cash-grain farms

See footrotes at end of table.

## State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued

Part 1 of 8.-Cash-grain farms
Data are based on reports for only a sample of farms. Setext]

2 Reported in small fractions.
${ }^{1}$ Includes milk equivalent of cream end butterfat sold.
${ }^{2}$ Does not include acreage for farms in th less than 20 bushels harvested.
${ }^{3}$ Does not include data for fsrms with leas than 20 trees and grepevines.

## State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959

Part 2 of 8.-Cotton farms
[Deta are based on reports for only a sample of fams. See cext]

See footnotes at end of table.

State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued

Part 2 of $8 .-$ Cotton farms

2 Reported in small fractions.
${ }^{1}$ Includes milk equivelent of cream and butterfat sold.
${ }^{2}$ Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farns with less than 20 trees and grapevines.

Part 3 of 8.-Other field-crop farms

Soe footnotes at end of table.

See footnotes at end of table.

State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY
ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued
Part 5 of 8.-Dairy farms
(Data are basm on repmets for only a sample of fams. andent

Z Reported in small fractions.
${ }^{1}$ Includes milk equivalent of cream and butterfat sold.
${ }^{2}$ Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farms with less than 20 trees and grapevines.

## State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued

Part 8 of 8.-General farms
[Oath are based on reports tor only a sample of farms, See text]

[^148]State Table 18.-FARMS AND FARM CHARACTERISTICS OF COMMERCIAL FARMS BY TYPE OF FARM BY ECONOMIC CLASS OF FARM: CENSUS OF 1959-Continued

Part 8 of 8.-General farms
Data are based an reports for only a anmple of farms. bee text )

Z Reported in small iractions.
${ }^{1}$ Includes milk equivalent of cream and butterlat sold.
${ }^{2}$ Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farms with less than 20 trees and grapevines.

State Table 19.-FARMS AND FARM CHARACTERINTIC'B BY TYPE OF FARM: CENSUS OF 1959
[Data arp hased on reports for only a shmple of farms. See text]

State Table 20.-FARMS ANII FARM CHARA("TERISTICS BY SIZE OF FARM: CENSUS OF 1959-Continued [Data are based on reports for onls a sample of famms. See text]

3 Leas than 0.05 percent
Includes milk equivalent of cream and butterfat sold.
Does not include acreage for farms with less than 20 bushels harvested.
${ }^{3}$ Does not include data for farms with less than 20 trees and grapevines.

State Table 20.-FARMS AND FARM CHARACTERISTICS BY SIZE OF FARM: (ENNSUS OF 1959-Continued [Data are basend on reports for unly a sample of famm. See cust |

State Table 21.-FARMS AND FARM CHARACTERISTICS BY TENURE OF OPERATOR: CENSUS OF 1959
Data are braed on raports for only a sample of farms. see text

    - Figures for cropland harvested and specffled crops relate to the crop years 1959, 1954, 1949, 1944, 1934, 1934, 1929, 1424, and 1417.
     harvested for grain.

    Value of com and other corn products sold.
    ${ }^{4}$ Corn cut for forage.
    ${ }^{\text {SSorghuas for all purposes, except for simp. }}$
    ${ }^{6}$ Value of sorghums sold for hay or forage included in value of sorghums sold for grain or seed.
    7 Sugarcane or sorghums for sirup not reported separately.
    ${ }^{8}$ The 1944 and 1939 figures do not include acres plowed under for green manure
    ${ }^{9}$ For 1944, aoybeans and compeas harvested for bay. Frior to 194, annual legumes saved for hay, but excluding vetches in lat
    ${ }^{10}$ Includes farms reporting compeas harvested for green peas only.
    ${ }^{1} 1$ Includes farms reporting
    ${ }^{12}$ For figures on annual legumes saved for hay, including cowpeas and peanut vines, see soybeans cut for hay.
    ${ }^{13}$ Calculated value of peanuta harvested for nuts, peanuts harvested for hay, and peanuts hogged or graced.
    ${ }^{14}$ Reported in bushels.
    ${ }^{15}$ For all Censuses except 1950, obtained by adding the individual hay crops.
    ${ }^{16}$ Includes oats cut for feeding unthreshed.
    ${ }^{27}$ Alfalfa, clover, and their mixtures cut for hay not reported separately.
    18 Silage crops other than corn and sorghums.
    ${ }^{19}$ Clover seed, except sweetclover.
    ${ }^{20}$ Clover seed, inciuding sweetclover.
    ${ }^{21}$ Value of ilnt cotton only.
     See text.
    ${ }^{23}$ Sugarcane for all purposes.
    ${ }^{24}$ Inciudea receipts fram aale of pasture and graing privileges and the value of compeas harvested for green peas.
    ${ }^{29}$ Excludes recelpts fram ale of pasture and grazing privileges and the value of compeas harvested for green peas.
    ${ }^{2}$ Excludes Irlish and aweet potatoes.
    ${ }^{27}$ Does not include farms reporting green compeas onily.
    ${ }^{28}$ Does not include the value of green corpeas aold. See footnote 24 .
    ${ }^{29}$ Green 1 Ina beans included with snap bears.
    ${ }^{30}$ Green onions included with shallots.
    ${ }^{32}$ Hot peppers and plifientoa included with sweet peppers.
    ${ }^{32}$ pymientoa included with sweet peppers.
    ${ }_{33}{ }^{3}$ For Censues prior to 1950, small frults harvested for bame use or for sale
    ${ }^{34}$ For 1959 and 1954, does not include data for farms with less than 20 trees and grapevines. See text
    ${ }_{36}$ Does not fnciude acreage for fares reporting less than $1 / 2$ acre. See text
     1945, harvested in 1943 fram the bloar of 1943; for 1940, harvested in 1939-iofram the bloan of 1939.
